Verified Approximation Algorithms

Robin Eßmann, Tobias Nipkow, Simon Robillard, Ujkan Sulejmani

December 14, 2021

Abstract

We present the first formal verifications of approximation algorithms for NP-complete optimization problems: vertex cover, set cover, independent set, center selection, load balancing, and bin packing. The proofs correct incompletnesses in existing proofs and improve the approximation ratio in one case. A detailed description of our work (excluding center selection) has been published in the proceedings of *IJCAR 2020* [3].

Contents

1 Vertex Cover

theory *Approx-VC-Hoare*
imports *HOL−Hoare.Hoare-Logic*
begin

The algorithm is classical, the proof is based on and augments the one by Berghammer and Müller-Olm [1].

1.1 Graph

A graph is simply a set of edges, where an edge is a 2-element set.

definition *vertex-cover* :: *'a set set* ⇒ *'a set* ⇒ *bool* **where**
vertex-cover E C = (∀ *e* ∈ *E*. *e* ∩ *C* ≠ {})

abbreviation *matching* :: *'a set set* ⇒ *bool* **where**
matching M ≡ *pairwise disjnt M*

lemma *card-matching-vertex-cover*:
⟦ *finite C*; *matching M*; *M* ⊆ *E*; *vertex-cover E C* ⟧ ⟹ *card M* ≤ *card C*
⟨*proof*⟩

1.2 The Approximation Algorithm

Formulated using a simple(!) predefined Hoare-logic. This leads to a streamlined proof based on standard invariant reasoning.

The nondeterministic selection of an element from a set F is simulated by *SOME x*. *x* ∈ *F*. The *SOME* operator is built into HOL: *SOME x*. *P x* denotes some x that satisfies P if such an x exists; otherwise it denotes an arbitrary element. Note that there is no actual nondeterminism involved: *SOME x*. *P x* is some fixed element but in general we don't know which one. Proofs about *SOME* are notoriously tedious. Typically it involves showing first that ∃ *x*. *P x*. Then ∃ *x*. *?P x* ⟹ *?P* (*SOME x*. *?P x*) implies *P* (*SOME x*. *P x*). There are a number of (more) useful related theorems: just click on ∃ *x*. *?P x* ⟹ *?P* (*SOME x*. *?P x*) to be taken there.

Convenient notation for choosing an arbitrary element from a set:

abbreviation *some A* ≡ *SOME x. x* ∈ *A*

locale *Edges* =
  fixes *E* :: *'a set set*
  assumes *finE*: *finite E*
  assumes *edges2*: *e* ∈ *E* ⟹ *card e* = *2*
begin

The invariant:

definition *inv-matching C F M* =
  (*matching M* ∧ *M* ⊆ *E* ∧ *card C* ≤ *2* ∗ *card M* ∧ (∀ *e* ∈ *M*. ∀ *f* ∈ *F*. *e* ∩ *f* = {}))

definition *invar* :: *'a set* ⇒ *'a set set* ⇒ *bool* **where**
invar C F = (*F* ⊆ *E* ∧ *vertex-cover* (*E*−*F*) *C* ∧ *finite C* ∧ (∃ *M*. *inv-matching C F M*))

Preservation of the invariant by the loop body:

lemma *invar-step*:
  assumes *F* ≠ {} *invar C F*
  shows *invar* (*C* ∪ *some F*) (*F* − {*e'* ∈ *F*. *some F* ∩ *e'* ≠ {}})
⟨*proof*⟩

lemma *approx-vertex-cover*:
VARS C F
  {*True*}
  C := {};
  F := *E*;
  WHILE F ≠ {}
  INV {*invar C F*}
  DO C := *C* ∪ *some F*;
    F := *F* − {*e'* ∈ *F*. *some F* ∩ *e'* ≠ {}}
  OD
  {*vertex-cover E C* ∧ (∀ *C'*. *finite C'* ∧ *vertex-cover E C'* ⟶ *card C* ≤ *2* ∗ *card C'*)}
⟨*proof*⟩

end

1.3 Version for Hypergraphs

Almost the same. We assume that the degree of every edge is bounded.

locale *Bounded-Hypergraph* =
  fixes *E* :: *'a set set*
  fixes *k* :: *nat*
  assumes *finE*: *finite E*
  assumes *edge-bnd*: *e* ∈ *E* ⟹ *finite e* ∧ *card e* ≤ *k*
  assumes *E1*: {} ∉ *E*

begin

definition *inv-matching C F M* =
(*matching M* ∧ *M* ⊆ *E* ∧ *card C* ≤ *k* ∗ *card M* ∧ (∀ *e* ∈ *M*. ∀ *f* ∈ *F*. *e* ∩ *f* = {}))

definition *invar* :: *'a set* ⇒ *'a set set* ⇒ *bool* **where**
invar C F = (*F* ⊆ *E* ∧ *vertex-cover* (*E*−*F*) *C* ∧ *finite C* ∧ (∃ *M*. *inv-matching C F M*))

lemma *invar-step*:
assumes *F* ≠ {} *invar C F*
shows *invar* (*C* ∪ *some F*) (*F* − {*e'* ∈ *F*. *some F* ∩ *e'* ≠ {}})
⟨*proof*⟩

lemma *approx-vertex-cover-bnd*:
VARS C F
{*True*}
C := {};
F := *E*;
WHILE F ≠ {}
INV {*invar C F*}
DO C := *C* ∪ *some F*;
F := *F* − {*e'* ∈ *F*. *some F* ∩ *e'* ≠ {}}
OD
{*vertex-cover E C* ∧ (∀ *C'*. *finite C'* ∧ *vertex-cover E C'* ⟶ *card C* ≤ *k* ∗ *card C'*)}
⟨*proof*⟩

end

end

2 Set Cover

theory *Approx-SC-Hoare*
imports
HOL−Hoare.Hoare-Logic
Complex-Main
begin

This is a formalization of the set cover algorithm and proof in the book by Kleinberg and Tardos [4].

definition *harm* :: *nat* ⇒ *'a* :: *real-normed-field* **where**
harm n = (∑ *k*=*1*..*n*. *inverse* (*of-nat k*))

locale *Set-Cover* =

fixes $w :: nat \Rightarrow real$
and $m :: nat$
and $S :: nat \Rightarrow 'a\ set$
assumes *S-finite*: $\forall i \in \{1..m\}.\ finite\ (S\ i)$
and *w-nonneg*: $\forall i.\ 0 \leq w\ i$
begin

definition $U :: 'a\ set$ **where**
$U = (\bigcup i \in \{1..m\}.\ S\ i)$

lemma *S-subset*: $\forall i \in \{1..m\}.\ S\ i \subseteq U$
⟨*proof*⟩

lemma *U-finite*: *finite U*
⟨*proof*⟩

lemma *empty-cover*: $m = 0 \Longrightarrow U = \{\}$
⟨*proof*⟩

definition $sc :: nat\ set \Rightarrow 'a\ set \Rightarrow bool$ **where**
$sc\ C\ X \longleftrightarrow C \subseteq \{1..m\} \wedge (\bigcup i \in C.\ S\ i) = X$

definition $cost :: 'a\ set \Rightarrow nat \Rightarrow real$ **where**
$cost\ R\ i = w\ i\ /\ card\ (S\ i \cap R)$

lemma *cost-nonneg*: $0 \leq cost\ R\ i$
⟨*proof*⟩

$cost\ R\ i = 0$ if $card\ (S\ i \cap R) = 0$! Needs to be accounted for separately in *min-arg*.

fun $min\text{-}arg :: 'a\ set \Rightarrow nat \Rightarrow nat$ **where**
$min\text{-}arg\ R\ 0 = 1$
| $min\text{-}arg\ R\ (Suc\ x) =$
$(let\ j = min\text{-}arg\ R\ x$
$in\ if\ S\ j \cap R = \{\} \vee (S\ (Suc\ x) \cap R \neq \{\} \wedge cost\ R\ (Suc\ x) < cost\ R\ j)\ then\ (Suc\ x)\ else\ j)$

lemma *min-in-range*: $k > 0 \Longrightarrow min\text{-}arg\ R\ k \in \{1..k\}$
⟨*proof*⟩

lemma *min-empty*: $S\ (min\text{-}arg\ R\ k) \cap R = \{\} \Longrightarrow \forall i \in \{1..k\}.\ S\ i \cap R = \{\}$

3 Independent Set

theory *Approx-MIS-Hoare*
imports
HOL−Hoare.Hoare-Logic
HOL−Library.Disjoint-Sets
begin

The algorithm is classical, the proofs are inspired by the ones by Berghammer and Müller-Olm [1]. In particular the approximation ratio is improved from $\Delta+1$ to Δ.

3.1 Graph

A set set is simply a set of edges, where an edge is a 2-element set.

definition *independent-vertices* :: *'a set set* ⇒ *'a set* ⇒ *bool* **where**
independent-vertices E S ⟷ *S* ⊆ ⋃ *E* ∧ (∀ *v1 v2*. *v1* ∈ *S* ∧ *v2* ∈ *S* ⟶ {*v1*, *v2*} ∉ *E*)

locale *Graph-E* =
fixes *E* :: *'a set set*
assumes *finite-E*: *finite E*

assumes *edges2*: $e \in E \Longrightarrow card\ e = 2$
begin

fun *vertices* :: $'a\ set\ set \Rightarrow 'a\ set$ **where**
$vertices\ G = \bigcup G$

abbreviation V :: $'a\ set$ **where**
$V \equiv vertices\ E$

definition *approximation-miv* :: $nat \Rightarrow 'a\ set \Rightarrow bool$ **where**
$approximation\text{-}miv\ n\ S \longleftrightarrow independent\text{-}vertices\ E\ S \wedge (\forall S'.\ independent\text{-}vertices\ E\ S' \longrightarrow card\ S' \leq card\ S * n)$

fun *neighbors* :: $'a \Rightarrow 'a\ set$ **where**
$neighbors\ v = \{u.\ \{u,v\} \in E\}$

fun *degree-vertex* :: $'a \Rightarrow nat$ **where**
$degree\text{-}vertex\ v = card\ (neighbors\ v)$

abbreviation Δ :: *nat* **where**
$\Delta \equiv Max\{degree\text{-}vertex\ u | u.\ u \in V\}$

lemma *finite-edges*: $e \in E \Longrightarrow finite\ e$
⟨*proof*⟩

lemma *finite-V*: $finite\ V$
⟨*proof*⟩

lemma *finite-neighbors*: $finite\ (neighbors\ u)$
⟨*proof*⟩

lemma *independent-vertices-finite*: $independent\text{-}vertices\ E\ S \Longrightarrow finite\ S$
⟨*proof*⟩

lemma *edge-ex-vertices*: $e \in E \Longrightarrow \exists\, u\ v.\ u \neq v \wedge e = \{u, v\}$
⟨*proof*⟩

lemma Δ-*pos* [*simp*]: $E = \{\} \vee 0 < \Delta$
⟨*proof*⟩

lemma Δ-*max-degree*: $u \in V \Longrightarrow degree\text{-}vertex\ u \leq \Delta$
⟨*proof*⟩

3.2 Wei's algorithm: (Δ+1)-approximation

The 'functional' part of the invariant, used to prove that the algorithm produces an independent set of vertices.

definition *inv-iv* :: $'a\ set \Rightarrow 'a\ set \Rightarrow bool$ **where**
$inv\text{-}iv\ S\ X \longleftrightarrow independent\text{-}vertices\ E\ S$

$\wedge\ X \subseteq V$
$\wedge\ (\forall\, v1 \in (V - X).\ \forall\, v2 \in S.\ \{v1,\ v2\} \notin E)$
$\wedge\ S \subseteq X$

Strenghten the invariant with an approximation ratio r:

definition *inv-approx* :: *'a set* ⇒ *'a set* ⇒ *nat* ⇒ *bool* **where**
inv-approx S X r ⟷ *inv-iv S X* ∧ *card X* ≤ *card S* ∗ *r*

Preservation of the functional invariant:

lemma *inv-preserv*:
fixes *S* :: *'a set*
and *X* :: *'a set*
and *x* :: *'a*
assumes *inv*: *inv-iv S X*
and *x-def*: *x* ∈ *V* − *X*
shows *inv-iv* (*insert x S*) (*X* ∪ *neighbors x* ∪ {*x*})
⟨*proof*⟩

lemma *inv-approx-preserv*:
assumes *inv*: *inv-approx S X* (Δ + *1*)
and *x-def*: *x* ∈ *V* − *X*
shows *inv-approx* (*insert x S*) (*X* ∪ *neighbors x* ∪ {*x*}) (Δ + *1*)
⟨*proof*⟩

lemma *inv-approx*: *independent-vertices E S* ⟹ *card V* ≤ *card S* ∗ *r* ⟹ *approximation-miv r S*
⟨*proof*⟩

theorem *wei-approx-Δ-plus-1*:
VARS (*S* :: *'a set*) (*X* :: *'a set*) (*x* :: *'a*)
{ *True* }
S := {};
X := {};
WHILE X ≠ *V*
INV { *inv-approx S X* (Δ + *1*) }
DO x := (*SOME x*. *x* ∈ *V* − *X*);
S := *insert x S*;
X := *X* ∪ *neighbors x* ∪ {*x*}
OD
{ *approximation-miv* (Δ + *1*) *S* }
⟨*proof*⟩

3.3 Wei's algorithm: Δ-approximation

The previous approximation uses very little information about the optimal solution (it has at most as many vertices as the set itself). With some extra effort we can improve the ratio to Δ instead of Δ+*1*. In order to do that we must show that among the vertices removed in each iteration, at most Δ

could belong to an optimal solution. This requires carrying around a set P (via a ghost variable) which records the vertices deleted in each iteration.

definition *inv-partition* :: *'a set* ⇒ *'a set* ⇒ *'a set set* ⇒ *bool* **where**
inv-partition S X P ⟷ *inv-iv S X*
∧ ⋃ *P* = *X*
∧ (∀ *p* ∈ *P*. ∃ *s* ∈ *V*. *p* = {*s*} ∪ *neighbors s*)
∧ *card P* = *card S*
∧ *finite P*

lemma *inv-partition-preserv*:
assumes *inv*: *inv-partition S X P*
and *x-def*: *x* ∈ *V* − *X*
shows *inv-partition* (*insert x S*) (*X* ∪ *neighbors x* ∪ {*x*}) (*insert* ({*x*} ∪ *neighbors x*) *P*)
⟨*proof*⟩

lemma *card-Union-le-sum-card*:
fixes *U* :: *'a set set*
assumes ∀ *u* ∈ *U*. *finite u*
shows *card* (⋃ *U*) ≤ *sum card U*
⟨*proof*⟩

lemma *sum-card*:

and *n* :: *nat*
assumes ∀ *S* ∈ *U*. *card S* ≤ *n*
shows *sum card U* ≤ *card U* ∗ *n*
⟨*proof*⟩

lemma *x-or-neighbors*:
fixes *P* :: *'a set set*
and *S* :: *'a set*
assumes *inv*: ∀ *p*∈*P*. ∃ *s* ∈ *V*. *p* = {*s*} ∪ *neighbors s*
and *ivS*: *independent-vertices E S*
shows ∀ *p* ∈ *P*. *card* (*S* ∩ *p*) ≤ Δ
⟨*proof*⟩

lemma *inv-partition-approx*: *inv-partition S V P* ⟹ *approximation-miv* Δ *S*
⟨*proof*⟩

theorem *wei-approx-*Δ:
VARS (*S* :: *'a set*) (*X* :: *'a set*) (*x* :: *'a*)
{ *True* }
S := {};
X := {};
WHILE X ≠ *V*

INV { ∃ *P*. *inv-partition S X P* }
DO x := (*SOME x*. *x* ∈ *V* − *X*);
S := *insert x S*;
X := *X* ∪ *neighbors x* ∪ {*x*}
OD
{ *approximation-miv* Δ *S* }
⟨*proof*⟩

3.4 Wei's algorithm with dynamically computed approximation ratio

In this subsection, we augment the algorithm with a variable used to compute the effective approximation ratio of the solution. In addition, the vertex of smallest degree is picked. With this heuristic, the algorithm achieves an approximation ratio of $(\Delta+2)/3$, but this is not proved here.

definition *vertex-heuristic* :: *'a set* ⇒ *'a* ⇒ *bool* **where**
vertex-heuristic X v = (∀ *u* ∈ *V* − *X*. *card* (*neighbors v* − *X*) ≤ *card* (*neighbors u* − *X*))

lemma *ex-min-finite-set*:
fixes *S* :: *'a set*
and *f* :: *'a* ⇒ *nat*
shows *finite S* ⟹ *S* ≠ {} ⟹ ∃ *x*. *x* ∈ *S* ∧ (∀ *y* ∈ *S*. *f x* ≤ *f y*)
(**is** *?P1* ⟹ *?P2* ⟹ ∃ *x*. *?minf S x*)
⟨*proof*⟩

lemma *inv-approx-preserv2*:
fixes *S* :: *'a set*
and *X* :: *'a set*
and *s* :: *nat*
and *x* :: *'a*
assumes *inv*: *inv-approx S X s*
and *x-def*: *x* ∈ *V* − *X*
shows *inv-approx* (*insert x S*) (*X* ∪ *neighbors x* ∪ {*x*}) (*max* (*card* (*neighbors x* ∪ {*x*} − *X*)) *s*)
⟨*proof*⟩

theorem *wei-approx-min-degree-heuristic*:
VARS (*S* :: *'a set*) (*X* :: *'a set*) (*x* :: *'a*) (*r* :: *nat*)
{ *True* }
S := {};
X := {};
r := *0*;
WHILE X ≠ *V*
INV { *inv-approx S X r* }
DO x := (*SOME x*. *x* ∈ *V* − *X* ∧ *vertex-heuristic X x*);
S := *insert x S*;

shows (∑ *x* ∈ {*1..m*}. *T x*) = (∑ *x* ∈ {*1..j*}. *t x*)
⟨*proof*⟩

4.1.2 Lower Bounds for the Makespan

If *T* and *A* are a correct load balancing for *j* jobs and *m* machines, then the processing time of any job *x* ∈ {*1..j*} is a lower bound for the load of some machine *y* ∈ {*1..m*}

lemma *job-lower-bound-machine*:
assumes *lb T A j x* ∈ {*1..j*}
shows ∃ *y* ∈ {*1..m*}. *t x* ≤ *T y*
⟨*proof*⟩

As the load of any machine is a lower bound for the makespan, the processing time of any job *x* ∈ {*1..j*} has to also be a lower bound for the makespan. Follows from *job-lower-bound-machine* and *makespan-correct*.

lemma *job-lower-bound-makespan*:
assumes *lb T A j x* ∈ {*1..j*}
shows *t x* ≤ *makespan T*
⟨*proof*⟩

The makespan over *j* jobs is a lower bound for the makespan of any correct load balancing for *j* jobs.

lemma *max-job-lower-bound-makespan*:
assumes *lb T A j*
shows *Max*$_0$ (*t* ‘ {*1..j*}) ≤ *makespan T*
⟨*proof*⟩

lemma *job-dist-lower-bound-makespan*:
assumes *lb T A j*
shows $(\sum x \in \{1..j\}.\ t\ x)\ /\ m \leq$ *makespan T*
⟨*proof*⟩

4.2 The Greedy Approximation Algorithm

This function will perform a linear scan from $k \in \{1..m\}$ and return the index of the machine with minimum load assuming $m > 0$

fun *min-arg* :: $(nat \Rightarrow nat) \Rightarrow nat \Rightarrow nat$ **where**
min-arg T 0 = *1*
| *min-arg T* (*Suc x*) =
(*let k* = *min-arg T x*
in if T (*Suc x*) < *T k then* (*Suc x*) *else k*)

lemma *min-correct*:
$\forall x \in \{1..m\}.\ T\ (min\text{-}arg\ T\ m) \leq T\ x$
⟨*proof*⟩

lemma *min-in-range*:
$k > 0 \Longrightarrow (min\text{-}arg\ T\ k) \in \{1..k\}$
⟨*proof*⟩

lemma *add-job*:
assumes *lb T A j* $x \in \{1..m\}$
shows *lb* (*T* (*x* := *T x* + *t* (*Suc j*))) (*A* (*x* := *A x* ∪ {*Suc j*})) (*Suc j*)
(**is** ‹*lb ?T ?A* ->›)
⟨*proof*⟩

lemma *makespan-mono*:
$y \leq T\ x \Longrightarrow$ *makespan* (*T* (*x* := *y*)) ≤ *makespan T*
$T\ x \leq y \Longrightarrow$ *makespan T* ≤ *makespan* (*T* (*x* := *y*))
⟨*proof*⟩

lemma *smaller-optimum*:
assumes *lb T A* (*Suc j*)
shows $\exists\ T'\ A'.$ *lb T' A' j* ∧ *makespan T'* ≤ *makespan T*
⟨*proof*⟩

If the processing time y does not contribute to the makespan, we can ignore it.

lemma *remove-small-job*:
assumes *makespan* (*T* (*x* := *T x* + *y*)) ≠ *T x* + *y*
shows *makespan* (*T* (*x* := *T x* + *y*)) = *makespan T*
⟨*proof*⟩

lemma *greedy-makespan-no-jobs* [*simp*]:
makespan (λ-. *0*) = *0*
⟨*proof*⟩

lemma *min-avg*: $m * T\ (\textit{min-arg}\ T\ m) \leq (\sum i \in \{1..m\}.\ T\ i)$
(**is** ‹- * ?T ≤ ?S›)
⟨*proof*⟩

definition $\textit{inv}_1 :: (\textit{nat} \Rightarrow \textit{nat}) \Rightarrow (\textit{nat} \Rightarrow \textit{nat set}) \Rightarrow \textit{nat} \Rightarrow \textit{bool}$ **where**
$\textit{inv}_1\ T\ A\ j = (\textit{lb}\ T\ A\ j \wedge j \leq n \wedge (\forall T'\ A'.\ \textit{lb}\ T'\ A'\ j \longrightarrow \textit{makespan}\ T \leq 2 * \textit{makespan}\ T'))$

lemma $\textit{inv}_1 E$:
assumes $\textit{inv}_1\ T\ A\ j$
shows $\textit{lb}\ T\ A\ j\ j \leq n$
$\textit{lb}\ T'\ A'\ j \Longrightarrow \textit{makespan}\ T \leq 2 * \textit{makespan}\ T'$
⟨*proof*⟩

lemma $\textit{inv}_1 I$:
assumes $\textit{lb}\ T\ A\ j\ j \leq n\ \forall T'\ A'.\ \textit{lb}\ T'\ A'\ j \longrightarrow \textit{makespan}\ T \leq 2 * \textit{makespan}\ T'$
shows $\textit{inv}_1\ T\ A\ j$ ⟨*proof*⟩

5 Bin Packing

theory *Approx-BP-Hoare*
imports *Complex-Main HOL−Hoare.Hoare-Logic HOL−Library.Disjoint-Sets*
begin

The algorithm and proofs are based on the work by Berghammer and Reuter [2].

5.1 Formalization of a Correct Bin Packing

Definition of the unary operator $[\![\cdot]\!]$ from the article. B will only be wrapped into a set if it is non-empty.

definition *wrap* :: *'a set* ⇒ *'a set set* **where**
wrap B = (*if B* = {} *then* {} *else* {*B*})

lemma *wrap-card*:
card (*wrap B*) ≤ *1*
⟨*proof*⟩

If M and N are pairwise disjoint with V and not yet contained in V, then the union of M and N is also pairwise disjoint with V.

lemma *pairwise-disjnt-Un*:
assumes *pairwise disjnt* $(\{M\} \cup \{N\} \cup V)$ $M \notin V$ $N \notin V$
shows *pairwise disjnt* $(\{M \cup N\} \cup V)$
⟨*proof*⟩

A Bin Packing Problem is defined like in the article:

locale *BinPacking* =
fixes U :: *'a set* — A finite, non-empty set of objects
and w :: *'a* ⇒ *real* — A mapping from objects to their respective weights (positive real numbers)
and c :: *nat* — The maximum capacity of a bin (a natural number)
and S :: *'a set* — The set of *small* objects (weight no larger than *1/2* of c)
and L :: *'a set* — The set of *large* objects (weight larger than *1/2* of c)
assumes *weight*: $\forall u \in U.\ 0 < w(u) \wedge w(u) \leq c$
and *U-Finite*: *finite* U
and *U-NE*: $U \neq \{\}$
and *S-def*: $S = \{u \in U.\ w(u) \leq c\ /\ 2\}$
and *L-def*: $L = U - S$
begin

In the article, this is defined as w as well. However, to avoid ambiguity, we will abbreviate the weight of a bin as W.

abbreviation W :: *'a set* ⇒ *real* **where**
$W\ B \equiv (\sum u \in B.\ w(u))$

P constitutes as a correct bin packing if P is a partition of U (as defined in *partition-on-def*) and the weights of the bins do not exceed their maximum capacity c.

definition *bp* :: *'a set set* ⇒ *bool* **where**
bp $P \longleftrightarrow$ *partition-on* $U\ P \wedge (\forall B \in P.\ W(B) \leq c)$

lemma *bpE*:
assumes *bp* P
shows *pairwise disjnt* P $\{\} \notin P$ $\bigcup P = U$ $\forall B \in P.\ W(B) \leq c$
⟨*proof*⟩

lemma *bpI*:
assumes *pairwise disjnt* P $\{\} \notin P$ $\bigcup P = U$ $\forall B \in P.\ W(B) \leq c$
shows *bp* P
⟨*proof*⟩

Although we assume the S and L sets as given, manually obtaining them from U is trivial and can be achieved in linear time. Proposed by the article [2].

lemma *S-L-set-generation*:
VARS S L W u
{*True*}
$S := \{\}$; $L := \{\}$; $W := U$;
WHILE $W \neq \{\}$

INV $\{W \subseteq U \wedge S = \{v \in U - W.\ w(v) \leq c\ /\ 2\} \wedge L = \{v \in U - W.\ w(v) > c\ /\ 2\}\}$ *DO*
$u := (SOME\ u.\ u \in W)$;
IF $2 * w(u) \leq c$
THEN $S := S \cup \{u\}$
ELSE $L := L \cup \{u\}$ *FI*;
$W := W - \{u\}$
OD
$\{S = \{v \in U.\ w(v) \leq c\ /\ 2\} \wedge L = \{v \in U.\ w(v) > c\ /\ 2\}\}$
⟨*proof*⟩

5.2 The Proposed Approximation Algorithm

5.2.1 Functional Correctness

According to the article, inv_1 holds if $P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2 \cup \{\{v\}\ |v.\ v \in V\}$ is a correct solution for the bin packing problem [2]. However, various assumptions made in the article seem to suggest that more information is demanded from this invariant and, indeed, mere correctness (as defined in *bp-def*) does not appear to suffice. To amend this, four additional conjuncts have been added to this invariant, whose necessity will be explained in the following proofs. It should be noted that there may be other (shorter) ways to amend this invariant. This approach, however, makes for rather straight-forward proofs, as these conjuncts can be utilized and proved in relatively few steps.

definition $inv_1 :: 'a\ set\ set \Rightarrow 'a\ set\ set \Rightarrow 'a\ set \Rightarrow 'a\ set \Rightarrow 'a\ set \Rightarrow bool$ **where**
$inv_1\ P_1\ P_2\ B_1\ B_2\ V \longleftrightarrow bp\ (P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2 \cup \{\{v\}\ |v.\ v \in V\})$ — A correct solution to the bin packing problem
$\wedge \bigcup(P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2) = U - V$ — The partial solution does not contain objects that have not yet been assigned
$\wedge B_1 \notin (P_1 \cup P_2 \cup wrap\ B_2)$ — B_1 is distinct from all the other bins
$\wedge B_2 \notin (P_1 \cup wrap\ B_1 \cup P_2)$ — B_2 is distinct from all the other bins
$\wedge (P_1 \cup wrap\ B_1) \cap (P_2 \cup wrap\ B_2) = \{\}$ — The first and second partial solutions are disjoint from each other.

lemma inv_1E:
assumes $inv_1\ P_1\ P_2\ B_1\ B_2\ V$
shows $bp\ (P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2 \cup \{\{v\}\ |v.\ v \in V\})$
and $\bigcup(P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2) = U - V$
and $B_1 \notin (P_1 \cup P_2 \cup wrap\ B_2)$
and $B_2 \notin (P_1 \cup wrap\ B_1 \cup P_2)$
and $(P_1 \cup wrap\ B_1) \cap (P_2 \cup wrap\ B_2) = \{\}$
⟨*proof*⟩

lemma inv_1I:
assumes $bp\ (P_1 \cup wrap\ B_1 \cup P_2 \cup wrap\ B_2 \cup \{\{v\}\ |v.\ v \in V\})$

and $\bigcup(P_1 \cup \mathit{wrap}\ B_1 \cup P_2 \cup \mathit{wrap}\ B_2) = U - V$
and $B_1 \notin (P_1 \cup P_2 \cup \mathit{wrap}\ B_2)$
and $B_2 \notin (P_1 \cup \mathit{wrap}\ B_1 \cup P_2)$
and $(P_1 \cup \mathit{wrap}\ B_1) \cap (P_2 \cup \mathit{wrap}\ B_2) = \{\}$
shows $\mathit{inv}_1\ P_1\ P_2\ B_1\ B_2\ V$
⟨*proof*⟩

lemma *wrap-Un* [*simp*]: $\mathit{wrap}\ (M \cup \{x\}) = \{M \cup \{x\}\}$ ⟨*proof*⟩
lemma *wrap-empty* [*simp*]: $\mathit{wrap}\ \{\} = \{\}$ ⟨*proof*⟩
lemma *wrap-not-empty* [*simp*]: $M \neq \{\} \longleftrightarrow \mathit{wrap}\ M = \{M\}$ ⟨*proof*⟩

If inv_1 holds for the current partial solution, and the weight of an object $u \in V$ added to B_1 does not exceed its capacity, then inv_1 also holds if B_1 and $\{u\}$ are replaced by $B_1 \cup \{u\}$.

lemma inv_1*-stepA*:
assumes $\mathit{inv}_1\ P_1\ P_2\ B_1\ B_2\ V\ u \in V\ W(B_1) + w(u) \leq c$
shows $\mathit{inv}_1\ P_1\ P_2\ (B_1 \cup \{u\})\ B_2\ (V - \{u\})$
⟨*proof*⟩

If inv_1 holds for the current partial solution, and the weight of an object $u \in V$ added to B_2 does not exceed its capacity, then inv_1 also holds if B_2 and $\{u\}$ are replaced by $B_2 \cup \{u\}$.

lemma inv_1*-stepB*:
assumes $\mathit{inv}_1\ P_1\ P_2\ B_1\ B_2\ V\ u \in V\ W\ B_2 + w\ u \leq c$
shows $\mathit{inv}_1\ (P_1 \cup \mathit{wrap}\ B_1)\ P_2\ \{\}\ (B_2 \cup \{u\})\ (V - \{u\})$
⟨*proof*⟩

If inv_1 holds for the current partial solution, then inv_1 also holds if B_1 and B_2 are added to P_1 and P_2 respectively, B_1 is emptied and B_2 initialized with $u \in V$.

lemma inv_1*-stepC*:
assumes $\mathit{inv}_1\ P_1\ P_2\ B_1\ B_2\ V\ u \in V$
shows $\mathit{inv}_1\ (P_1 \cup \mathit{wrap}\ B_1)\ (P_2 \cup \mathit{wrap}\ B_2)\ \{\}\ \{u\}\ (V - \{u\})$
⟨*proof*⟩

A simplified version of the bin packing algorithm proposed in the article. It serves as an introduction into the approach taken, and, while it does not provide the desired approximation factor, it does ensure that P is a correct solution of the bin packing problem.

lemma *simple-bp-correct*:
VARS $P\ P_1\ P_2\ B_1\ B_2\ V\ u$
$\{\mathit{True}\}$
$P_1 := \{\}$; $P_2 := \{\}$; $B_1 := \{\}$; $B_2 := \{\}$; $V := U$;
WHILE $V \cap S \neq \{\}$ *INV* $\{\mathit{inv}_1\ P_1\ P_2\ B_1\ B_2\ V\}$ *DO*
$u := (\mathit{SOME}\ u.\ u \in V)$; $V := V - \{u\}$;
IF $W(B_1) + w(u) \leq c$
THEN $B_1 := B_1 \cup \{u\}$
ELSE IF $W(B_2) + w(u) \leq c$

THEN $B_2 := B_2 \cup \{u\}$
ELSE $P_2 := P_2 \cup \mathit{wrap}\ B_2$; $B_2 := \{u\}$ *FI*;
$P_1 := P_1 \cup \mathit{wrap}\ B_1$; $B_1 := \{\}$ *FI*
OD;
$P := P_1 \cup \mathit{wrap}\ B_1 \cup P_2 \cup \mathit{wrap}\ B_2 \cup \{\{v\} \mid v.\ v \in V\}$
$\{bp\ P\}$
⟨*proof*⟩

5.2.2 Lower Bounds for the Bin Packing Problem

lemma *bp-bins-finite* [*simp*]:
assumes *bp P*
shows $\forall B \in P.$ *finite B*
⟨*proof*⟩

lemma *bp-sol-finite* [*simp*]:
assumes *bp P*
shows *finite P*
⟨*proof*⟩

If P is a solution of the bin packing problem, then no bin in P may contain more than one large object.

lemma *only-one-L-per-bin*:
assumes *bp P* $B \in P$
shows $\forall x \in B.\ \forall y \in B.\ x \neq y \longrightarrow x \notin L \vee y \notin L$
⟨*proof*⟩

If P is a solution of the bin packing problem, then the amount of large objects is a lower bound for the amount of bins in P.

lemma *L-lower-bound-card*:
assumes *bp P*
shows *card* $L \leq$ *card P*
⟨*proof*⟩

If P is a solution of the bin packing problem, then the amount of bins of a subset of P in which every bin contains a large object is a lower bound on the amount of large objects.

lemma *subset-bp-card*:
assumes *bp P* $M \subseteq P\ \forall B \in M.\ B \cap L \neq \{\}$
shows *card* $M \leq$ *card L*
⟨*proof*⟩

If P is a correct solution of the bin packing problem, inv_1 holds for the partial solution, and every bin in $P_1 \cup \mathit{wrap}\ B_1$ contains a large object, then the amount of bins in $P_1 \cup \mathit{wrap}\ B_1 \cup \{\{v\}\ |v.\ v \in V \cap L\}$ is a lower bound for the amount of bins in P.

lemma *L-bins-lower-bound-card*:
assumes *bp P* inv_1 P_1 P_2 B_1 B_2 $V\ \forall B \in P_1 \cup \mathit{wrap}\ B_1.\ B \cap L \neq \{\}$

shows *card* $(P_1 \cup \mathit{wrap}\ B_1 \cup \{\{v\}\ |v.\ v \in V \cap L\}) \leq \mathit{card}\ P$
⟨*proof*⟩

If P is a correct solution of the bin packing problem, then the sum of the weights of the objects is equal to the sum of the weights of the bins in P.

lemma *sum-Un-eq-sum-sum*:
assumes *bp P*
shows $(\sum u \in U.\ w\ u) = (\sum B \in P.\ W\ B)$
⟨*proof*⟩

If P is a correct solution of the bin packing problem, then the sum of the weights of the items is a lower bound of amount of bins in P multiplied by their maximum capacity.

lemma *sum-lower-bound-card*:
assumes *bp P*
shows $(\sum u \in U.\ w\ u) \leq c * \mathit{card}\ P$
⟨*proof*⟩

lemma *bp-NE*:
assumes *bp P*
shows $P \neq \{\}$
⟨*proof*⟩

lemma *sum-Un-ge*:
fixes $f :: - \Rightarrow \mathit{real}$
assumes *finite M finite N* $\forall B \in M \cup N.\ 0 < f\ B$
shows *sum f M* $\leq$ *sum f* $(M \cup N)$
⟨*proof*⟩

If *bij-exists* holds, one can obtain a function which is bijective between the bins in P and the objects in V such that an object returned by the function would cause the bin to exceed its capacity.

definition *bij-exists* :: *'a set set* ⇒ *'a set* ⇒ *bool* **where**
bij-exists P V = $(\exists f.$ *bij-betw f P V* $\wedge$ $(\forall B \in P.\ W\ B + w\ (f\ B) > c))$

If P is a functionally correct solution of the bin packing problem, inv_1 holds for the partial solution, and such a bijective function exists between the bins in P_1 and the objects in $P_2 \cup \mathit{wrap}\ B_2$, the following strict lower bound can be shown:

lemma P_1*-lower-bound-card*:
assumes *bp P inv*$_1$ P_1 P_2 B_1 B_2 *V bij-exists* P_1 $(\bigcup(P_2 \cup \mathit{wrap}\ B_2))$
shows *card* $P_1 + 1 \leq$ *card P*
⟨*proof*⟩

As *card* (*wrap ?B*) $\leq$ *1* holds, it follows that the amount of bins in P_1 $\cup$ *wrap* B_1 are a lower bound for the amount of bins in P.

lemma P_1-B_1*-lower-bound-card*:

assumes *bp P inv*$_1$ P_1 P_2 B_1 B_2 V *bij-exists* P_1 $(\bigcup(P_2 \cup wrap\ B_2))$
shows *card* $(P_1 \cup wrap\ B_1) \leq card\ P$
⟨*proof*⟩

If *inv*$_1$ holds, there are at most half as many bins in P_2 as there are objects in P_2, and we can again obtain a bijective function between the bins in P_1 and the objects of the second partial solution, then the amount of bins in the second partial solution are a strict lower bound for half the bins of the first partial solution.

lemma P_2-B_2-*lower-bound*-P_1:
assumes *inv*$_1$ P_1 P_2 B_1 B_2 V $2 * card\ P_2 \leq card\ (\bigcup P_2)$ *bij-exists* P_1 $(\bigcup(P_2 \cup wrap\ B_2))$
shows $2 * card\ (P_2 \cup wrap\ B_2) \leq card\ P_1 + 1$
⟨*proof*⟩

5.2.3 Proving the Approximation Factor

We define *inv*$_2$ as it is defined in the article. These conjuncts allow us to prove the desired approximation factor.

definition *inv*$_2$ :: *'a set set* ⇒ *'a set set* ⇒ *'a set* ⇒ *'a set* ⇒ *'a set* ⇒ *bool* **where**
inv$_2$ P_1 P_2 B_1 B_2 V ⟷ *inv*$_1$ P_1 P_2 B_1 B_2 V — *inv*$_1$ holds for the partial solution
∧ $(V \cap L \neq \{\} \longrightarrow (\forall B \in P_1 \cup wrap\ B_1.\ B \cap L \neq \{\}))$ — If there are still large objects left, then every bin of the first partial solution must contain a large object
∧ *bij-exists* P_1 $(\bigcup(P_2 \cup wrap\ B_2))$ — There exists a bijective function between the bins of the first partial solution and the objects of the second one
∧ $(2 * card\ P_2 \leq card\ (\bigcup P_2))$ — There are at most twice as many bins in P_2 as there are objects in P_2

lemma *inv*$_2$*E*:
assumes *inv*$_2$ P_1 P_2 B_1 B_2 V
shows *inv*$_1$ P_1 P_2 B_1 B_2 V
and $V \cap L \neq \{\} \Longrightarrow \forall B \in P_1 \cup wrap\ B_1.\ B \cap L \neq \{\}$
and *bij-exists* P_1 $(\bigcup(P_2 \cup wrap\ B_2))$
and $2 * card\ P_2 \leq card\ (\bigcup P_2)$
⟨*proof*⟩

lemma *inv*$_2$*I*:
assumes *inv*$_1$ P_1 P_2 B_1 B_2 V
and $V \cap L \neq \{\} \Longrightarrow \forall B \in P_1 \cup wrap\ B_1.\ B \cap L \neq \{\}$
and *bij-exists* P_1 $(\bigcup(P_2 \cup wrap\ B_2))$
and $2 * card\ P_2 \leq card\ (\bigcup P_2)$
shows *inv*$_2$ P_1 P_2 B_1 B_2 V
⟨*proof*⟩

If P is a correct solution of the bin packing problem, *inv*$_2$ holds for the partial solution, and there are no more small objects left to be distributed,

then the amount of bins of the partial solution is no larger than *3 / 2* of the amount of bins in P. This proof strongly follows the proof in *Theorem 4.1* of the article [2].

lemma *bin-packing-lower-bound-card*:
assumes $V \cap S = \{\}$ *inv*$_2$ P_1 P_2 B_1 B_2 V *bp* P
shows *card* $(P_1 \cup$ *wrap* $B_1 \cup P_2 \cup$ *wrap* $B_2 \cup \{\{v\} \mid v.\ v \in V\}) \leq$ *3 / 2* $*$ *card* P
⟨*proof*⟩

We define *inv*$_3$ as it is defined in the article. This final conjunct allows us to prove that the invariant will be maintained by the algorithm.

definition *inv*$_3$ :: *'a set set* ⇒ *'a set set* ⇒ *'a set* ⇒ *'a set* ⇒ *'a set* ⇒ *bool* **where**
inv$_3$ P_1 P_2 B_1 B_2 $V \longleftrightarrow$ *inv*$_2$ P_1 P_2 B_1 B_2 $V \wedge B_2 \subseteq S$

lemma *inv*$_3$*E*:
assumes *inv*$_3$ P_1 P_2 B_1 B_2 V
shows *inv*$_2$ P_1 P_2 B_1 B_2 V **and** $B_2 \subseteq S$
⟨*proof*⟩

lemma *inv*$_3$*I*:
assumes *inv*$_2$ P_1 P_2 B_1 B_2 V **and** $B_2 \subseteq S$
shows *inv*$_3$ P_1 P_2 B_1 B_2 V
⟨*proof*⟩

lemma *loop-init*:
inv$_3$ {} {} {} {} U
⟨*proof*⟩

If B_1 is empty and there are no large objects left, then *inv*$_3$ will be maintained if B_1 is initialized with $u \in V \cap S$.

lemma *loop-stepA*:
assumes *inv*$_3$ P_1 P_2 B_1 B_2 V $B_1 = \{\}$ $V \cap L = \{\}$ $u \in V \cap S$
shows *inv*$_3$ P_1 P_2 $\{u\}$ B_2 $(V - \{u\})$
⟨*proof*⟩

If B_1 is empty and there are large objects left, then *inv*$_3$ will be maintained if B_1 is initialized with $u \in V \cap L$.

lemma *loop-stepB*:
assumes *inv*$_3$ P_1 P_2 B_1 B_2 V $B_1 = \{\}$ $u \in V \cap L$
shows *inv*$_3$ P_1 P_2 $\{u\}$ B_2 $(V - \{u\})$
⟨*proof*⟩

If B_1 is not empty and $u \in V \cap S$ does not exceed its maximum capacity, then *inv*$_3$ will be maintained if B_1 and $\{u\}$ are replaced with $B_1 \cup \{u\}$.

lemma *loop-stepC*:
assumes *inv*$_3$ P_1 P_2 B_1 B_2 V $B_1 \neq \{\}$ $u \in V \cap S$ W $B_1 + w(u) \leq c$
shows *inv*$_3$ P_1 P_2 $(B_1 \cup \{u\})$ B_2 $(V - \{u\})$
⟨*proof*⟩

If B_1 is not empty and $u \in V \cap S$ does exceed its maximum capacity but not the capacity of B_2, then inv_3 will be maintained if B_1 is added to P_1 and emptied, and B_2 and $\{u\}$ are replaced with $B_2 \cup \{u\}$.

lemma *loop-stepD*:
assumes $inv_3\ P_1\ P_2\ B_1\ B_2\ V\ B_1 \neq \{\}\ u \in V \cap S\ W\ B_1 + w(u) > c\ W\ B_2 + w(u) \leq c$
shows $inv_3\ (P_1 \cup wrap\ B_1)\ P_2\ \{\}\ (B_2 \cup \{u\})\ (V - \{u\})$
⟨*proof*⟩

If the maximum capacity of B_2 is exceeded by $u \in V \cap S$, then B_2 must contain at least two objects.

lemma *B_2-at-least-two-objects*:
assumes $inv_3\ P_1\ P_2\ B_1\ B_2\ V\ u \in V \cap S\ W\ B_2 + w(u) > c$
shows $2 \leq card\ B_2$
⟨*proof*⟩

If B_1 is not empty and $u \in V \cap S$ exceeds the maximum capacity of both B_1 and B_2, then inv_3 will be maintained if B_1 and B_2 are added to P_1 and P_2 respectively, emptied, and B_2 initialized with u.

lemma *loop-stepE*:
assumes $inv_3\ P_1\ P_2\ B_1\ B_2\ V\ B_1 \neq \{\}\ u \in V \cap S\ W\ B_1 + w(u) > c\ W\ B_2 + w(u) > c$
shows $inv_3\ (P_1 \cup wrap\ B_1)\ (P_2 \cup wrap\ B_2)\ \{\}\ \{u\}\ (V - \{u\})$
⟨*proof*⟩

The bin packing algorithm as it is proposed in the article [2]. P will not only be a correct solution of the bin packing problem, but the amount of bins will be a lower bound for *3 / 2* of the amount of bins of any correct solution Q, and thus guarantee an approximation factor of *3 / 2* for the optimum.

lemma *bp-approx*:

5.3 The Full Linear Time Version of the Proposed Algorithm

Finally, we prove the Algorithm proposed on page 78 of the article [2]. This version generates the S and L sets beforehand and uses them directly to calculate the solution, thus removing the need for intersection operations, and ensuring linear time if we can perform *insertion*, *removal*, *and selection of an element*, *the union of two sets*, *and the emptiness test in constant time* [2].

locale *BinPacking-Complete* =
fixes $U :: 'a\ set$ — A finite, non-empty set of objects
and $w :: 'a \Rightarrow real$ — A mapping from objects to their respective weights (positive real numbers)
and $c :: nat$ — The maximum capacity of a bin (as a natural number)
assumes *weight*: $\forall\, u \in U.\ 0 < w(u) \wedge w(u) \leq c$
and *U-Finite*: *finite U*
and *U-NE*: $U \neq \{\}$

⟨*proof*⟩

From this point onward, we will require a different approach for proving lower bounds. Instead of fixing and assuming the definitions of the S and L sets, we will introduce the abbreviations S_U and L_U for any occurrences of the original S and L sets. The union of S and L can be interpreted as V. As a result, occurrences of $V \cap S$ become $(S \cup L) \cap S = S$, and $V \cap L$

become $(S \cup L) \cap L = L$. Occurrences of these sets will have to be replaced appropriately.

abbreviation S_U **where**
$S_U \equiv \{u \in U.\ w\ u \leq c\ /\ 2\}$

abbreviation L_U **where**
$L_U \equiv \{u \in U.\ c\ /\ 2 < w\ u\}$

As we will remove elements from S and L, we will only be able to show that they remain subsets of S_U and L_U respectively.

6 Center Selection

theory *Center-Selection*
imports *Complex-Main HOL−Hoare.Hoare-Logic*
begin

The Center Selection (or metric k-center) problem. Given a set of *sites* S in a metric space, find a subset $C \subseteq S$ that minimizes the maximal distance from any $s \in S$ to some $c \in C$. This theory presents a verified 2-approximation algorithm. It is based on Section 11.2 in the book by Kleinberg and Tardos [4]. In contrast to the proof in the book, our proof is a standard invariant proof.

6.1 A Preliminary Algorithm and Proof

This subsection verifies an auxiliary algorithm by Kleinberg and Tardos. Our proof of the main algorithm does not does not rely on this auxiliary algorithm at all but we do reuse part off its invariant proof later on.

definition *inv* :: ('*a* :: *metric-space*) *set* ⇒ ('*a* :: *metric-space set*) ⇒ *real* ⇒ *bool*
where
inv S' C r =
((∀ *s* ∈ (*S* − *S'*). *distance C s* ≤ *2*∗*r*) ∧ *S'* ⊆ *S* ∧ *C* ⊆ *S* ∧
(∀ *c* ∈ *C*. ∀ *s* ∈ *S'*. *S'* ≠ {} ⟶ *dist c s* > *2* ∗ *r*) ∧ (*S'* = *S* ∨ *C* ≠ {}) ∧
(∀ *c*$_1$ ∈ *C*. ∀ *c*$_2$ ∈ *C*. *c*$_1$ ≠ *c*$_2$ ⟶ *dist c*$_1$ *c*$_2$ > *2* ∗ *r*))

lemma *inv-init*: *inv S* {} *r*
⟨*proof*⟩
lemma *inv-step*:
assumes *S'* ≠ {}
and *IH*: *inv S' C r*
defines[*simp*]: *s* ≡ (*SOME s*. *s* ∈ *S'*)
shows *inv* (*S'* − {*s'* . *s'* ∈ *S'* ∧ *dist s s'* ≤ *2*∗*r*}) (*C* ∪ {*s*}) *r*
⟨*proof*⟩

lemma *inv-last-1*:
assumes ∀ *s* ∈ (*S* − *S'*). *distance C s* ≤ *2*∗*r*
and *S'* = {}
shows *radius C* ≤ *2*∗*r*
⟨*proof*⟩

lemma *inv-last-2*:
assumes *finite C*
and *card C* > *n*
and *C* ⊆ *S*
and ∀ *c*$_1$ ∈ *C*. ∀ *c*$_2$ ∈ *C*. *c*$_1$ ≠ *c*$_2$ ⟶ *dist c*$_1$ *c*$_2$ > *2*∗*r*
shows ∀ *C'*. *card C'* ≤ *n* ∧ *card C'* > *0* ⟶ *radius C'* > *r* (**is** *?P*)
⟨*proof*⟩

lemma *inv-last*:
assumes *inv* {} *C r*
shows (*card C* ≤ *k* ⟶ *radius C* ≤ *2*∗*r*) ∧ (*card C* > *k* ⟶ (∀ *C'*. *card C'* > *0* ∧ *card C'* ≤ *k* ⟶ *radius C'* > *r*))
⟨*proof*⟩

theorem *Center-Selection-r*:
VARS (*S'* :: ('*a* :: *metric-space*) *set*) (*C* :: ('*a* :: *metric-space*) *set*) (*r* :: *real*) (*s* :: '*a*)
{*True*}
S' := *S*;
C := {};
WHILE S' ≠ {} *INV* {*inv S' C r*} *DO*
s := (*SOME s*. *s* ∈ *S'*);

$C := C \cup \{s\}$;
$S' := S' - \{s' \,.\, s' \in S' \wedge dist\ s\ s' \leq 2{*}r\}$
OD
$\{(card\ C \leq k \longrightarrow radius\ C \leq 2{*}r) \wedge (card\ C > k \longrightarrow (\forall\, C'.\ card\ C' > 0 \wedge card\ C' \leq k \longrightarrow radius\ C' > r))\}$
⟨*proof*⟩

6.2 The Main Algorithm

definition *invar* :: ('*a* :: *metric-space*) *set* ⇒ *bool* **where**
invar C = (*C* ≠ {} ∧ *card C* ≤ *k* ∧ *C* ⊆ *S* ∧
(∀ *C'*. (∀ c_1 ∈ *C*. ∀ c_2 ∈ *C*. $c_1 \neq c_2 \longrightarrow dist\ c_1\ c_2 > 2 * radius\ C'$)
∨ (∀ *s* ∈ *S*. *distance C s* ≤ 2 ∗ *radius C'*)))

abbreviation *some* **where** *some A* ≡ (*SOME s*. *s* ∈ *A*)

lemma *invar-init*: *invar* {*some S*}
⟨*proof*⟩

abbreviation *furthest-from* **where**
furthest-from C ≡ (*SOME s*. *s* ∈ *S* ∧ *distance C s* = *Max* (*distance C* ' *S*))

lemma *invar-step*:
assumes *invar C*
and *card C* < *k*
shows *invar* (*C* ∪ {*furthest-from C*})
⟨*proof*⟩

lemma *invar-last*:
assumes *invar C* **and** ¬*card C* < *k*
shows *card C* = *k* **and** *card C'* > 0 ∧ *card C'* ≤ *k* ⟶ *radius C* ≤ 2 ∗ *radius C'*
⟨*proof*⟩

theorem *Center-Selection*:
VARS (*C* :: ('*a* :: *metric-space*) *set*) (*s* :: ('*a* :: *metric-space*))
{*k* ≤ *card S*}
C := {*some S*};
WHILE card C < *k INV* {*invar C*} *DO*
C := *C* ∪ {*furthest-from C*}
OD
{*card C* = *k* ∧ (∀ *C'*. *card C'* > 0 ∧ *card C'* ≤ *k* ⟶ *radius C* ≤ 2 ∗ *radius C'*)}
⟨*proof*⟩
