Abstract

This article provides a formalization of the solution obtained by the author of the Problem “ARITHMETIC PROGRESSIONS” from the Putnam exam problems [1] of 2002. The statement of the problem is as follows: For which integers $n > 1$ does the set of positive integers less than and relatively prime to n constitute an arithmetic progression?

Statement of the problem (from [1]): For which integers $n > 1$ does the set of positive integers less than and relatively prime to n constitute an arithmetic progression?

The solution of the above problem is theorem *arith-prog-rel-primes-solution*.

First, we will require some auxiliary material before we get started with the actual solution.

1.1 Auxiliary results

lemma *even-and-odd-parts*:

fixes *n::nat*

assumes $\langle n \neq 0 \rangle$
shows $\langle \exists k q :: \text{nat}. n = (2 :: \text{nat})^k * q \wedge \text{odd } q \rangle$
 $\langle \text{proof} \rangle$

lemma *only-one-odd-div-power2*:

fixes $n :: \text{nat}$
assumes $\langle n \neq 0 \rangle$ **and** $\langle \bigwedge x. x \text{ dvd } n \implies \text{odd } x \implies x = 1 \rangle$
shows $\langle \exists k. n = (2 :: \text{nat})^k \rangle$
 $\langle \text{proof} \rangle$

lemma *coprime-power2*:

fixes $n :: \text{nat}$
assumes $\langle n \neq 0 \rangle$ **and** $\langle \bigwedge x. x < n \implies (\text{coprime } x \ n \longleftrightarrow \text{odd } x) \rangle$
shows $\langle \exists k. n = (2 :: \text{nat})^k \rangle$
 $\langle \text{proof} \rangle$

1.2 Main result

The solution to the problem ARITHMETIC PROGRESSIONS (Putnam exam problems 2002)

theorem *arith-prog-rel-primes-solution*:

fixes $n :: \text{nat}$
assumes $\langle n > 1 \rangle$
shows $\langle (\text{prime } n \vee (\exists k. n = 2^k) \vee n = 6) \longleftrightarrow$
 $(\exists a \ b \ m. m \neq 0 \wedge \{x \mid x < n \wedge \text{coprime } x \ n\} = \{a + j * b \mid j :: \text{nat}. j < m\}) \rangle$
 $\langle \text{proof} \rangle$
