

A Verified Functional Implementation of Bachmair and Ganzinger’s Ordered Resolution Prover

Anders Schlichtkrull, Jasmin Christian Blanchette, and Dmitriy Traytel

September 13, 2023

Abstract

This Isabelle/HOL formalization refines the abstract ordered resolution prover presented in Section 4.3 of Bachmair and Ganzinger’s “Resolution Theorem Proving” chapter in the *Handbook of Automated Reasoning*. The result is a functional implementation of a first-order prover.

1 Introduction

Bachmair and Ganzinger’s “Resolution Theorem Proving” chapter in the *Handbook of Automated Reasoning* is the standard reference on the topic. It defines a general framework for propositional and first-order resolution-based theorem proving. Resolution forms the basis for superposition, the calculus implemented in many popular automatic theorem provers.

This Isabelle/HOL formalization starts from an existing formalization of Bachmair and Ganzinger’s chapter, up to and including Section 4.3. It refines the abstract ordered resolution prover presented in Section 4.3 to obtain an executable, functional implementation of a first-order prover. Figure 1 shows the corresponding Isabelle theory structure.

We refer to the following conference paper for details:

Anders Schlichtkrull, Jasmin Christian Blanchette, Dmitriy Traytel:
A verified prover based on ordered resolution.

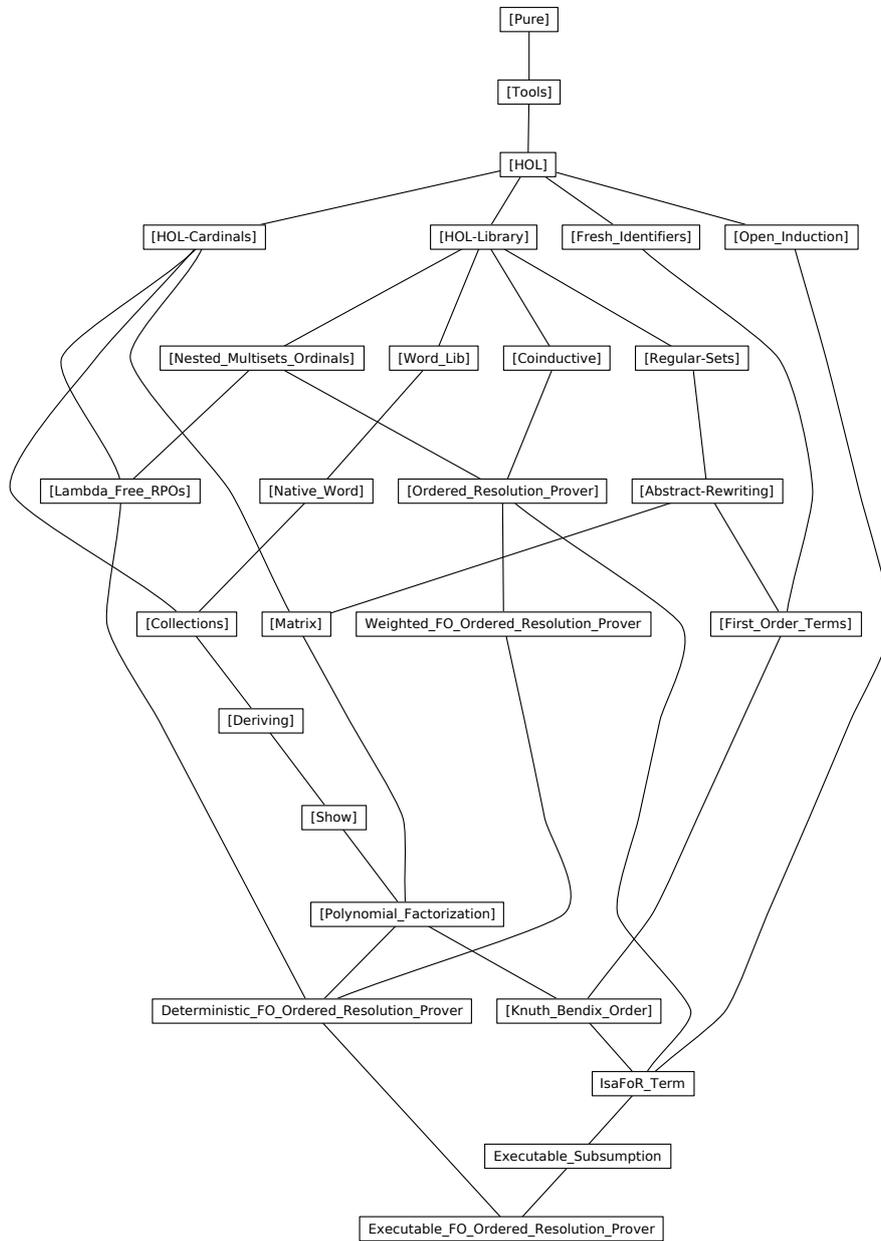

Figure 1: Theory dependency graph

2 A Fair Ordered Resolution Prover for First-Order Clauses with Weights

The *weighted_RP* prover introduced below operates on finite multisets of clauses and organizes the multiset of processed clauses as a priority queue to ensure that inferences are performed in a fair manner, to guarantee completeness.

3 A Deterministic Ordered Resolution Prover for First-Order Clauses

The *deterministic_RP* prover introduced below is a deterministic program that works on finite lists, committing to a strategy for assigning priorities to clauses. However, it is not fully executable: It abstracts over operations on atoms and employs logical specifications instead of executable functions for auxiliary notions.

5.3 Definition of Deterministic QuickSort

This is the functional description of the standard variant of deterministic QuickSort that always chooses the first list element as the pivot as given by Hoare in 1962. For a list that is already sorted, this leads to $n(n-1)$ comparisons, but as is well known, the average case is much better.

The code below is adapted from Manuel Eberl's *Quick_Sort_Cost* AFP entry, but without invoking probability theory and using a predicate instead of a set.

```

fun quicksort :: ('a  $\Rightarrow$  'a  $\Rightarrow$  bool)  $\Rightarrow$  'a list  $\Rightarrow$  'a list where
  quicksort _ [] = []
| quicksort R (x # xs) =
  quicksort R (filter ( $\lambda y. R y x$ ) xs) @ [x] @ quicksort R (filter ( $\lambda y. \neg R y x$ ) xs)

```

We can easily show that this QuickSort is correct:

```

theorem mset_quicksort [simp]: mset (quicksort R xs) = mset xs
by (induction R xs rule: quicksort.induct) simp_all

```

```

corollary set_quicksort [simp]: set (quicksort R xs) = set xs
by (induction R xs rule: quicksort.induct) auto

```

```

theorem sorted_wrt_quicksort:

```

```

  assumes transp R and totalp_on (set xs) R and reflp_on (set xs) R
  shows sorted_wrt R (quicksort R xs)

```

```

using assms

```

```

proof (induction R xs rule: quicksort.induct)

```

```

  case (2 R x xs)

```

```

  have total: R a b if  $\neg R b a$   $a \in \text{set } (x\#xs)$   $b \in \text{set } (x\#xs)$  for a b

```

```

  using 2.prems that unfolding totalp_on_def reflp_on_def by (cases a = b) auto

```

```

  have sorted_wrt R (quicksort R (filter ( $\lambda y. R y x$ ) xs))
    sorted_wrt R (quicksort R (filter ( $\lambda y. \neg R y x$ ) xs))

```

```

  using 2.prems by (intro 2.IH; auto simp: totalp_on_def reflp_on_def)+

```

```

  then show ?case

```

```

  by (auto simp: sorted_wrt_append  $\langle$ transp R $\rangle$ )

```

```

    intro: transpD[OF  $\langle$ transp R $\rangle$ ] dest!: total)

```

```

qed auto

```

End of the material adapted from Eberl's *Quick_Sort_Cost*.

```

lemma subsumes_list_subsumes_list_filter[abs_def, code_unfold]:

```

```

  subsumes_list Ls Ks  $\sigma$  = subsumes_list_filter (quicksort leq_lit Ls) Ks  $\sigma$ 

```

```

  by (rule trans[OF box_equals[OF subsumes_list_alt[symmetric] subsumes_list_alt[symmetric]]
    sorted_wrt_subsumes_list_subsumes_list_filter])

```

```

  (auto simp: sorted_wrt_quicksort)

```

```

end

```

6 An Executable Simple Ordered Resolution Prover for First-Order Clauses

This theory provides an executable functional implementation of the *deterministic_RP* prover, building on the *lsaFoR* library for the notion of terms and on the Knuth–Bendix order.
