From Abstract to Concrete Gödel's Incompleteness Theorems—Part II

Andrei Popescu Dmitriy Traytel

March 17, 2025

Abstract

We validate an abstract formulation of Gödels Second Incompleteness Theorem from a separate AFP entry by instantiating it to the case of *finite consistent extensions of the Hereditarily Finite (HF) Set theory*, i.e., consistent FOL theories extending the HF Set theory with a finite set of axioms.

The instantiation draws heavily on infrastructure previously developed by Larry Paulson in his direct formalisation of the concrete result. It strengthens Paulsons formalization of Gödel's Second from that entry by *not* assuming soundness, and in fact not relying on any notion of model or semantic interpretation. The strengthening was obtained by first replacing some of Paulsons semantic arguments with proofs within his HF calculus, and then plugging in some of Paulson's (modified) lemmas to instantiate our soundness-free Gödel's Second locale.

equality_axioms = {*refl_ax*, *eq_cong_ax*, *mem_cong_ax*, *eats_cong_ax*}

1.2.5 The proof system

This arbitrary additional axiom generalises the statements of the incompleteness theorems and other results to any formal system stronger than the HF theory. The additional axiom could be the conjunction of any finite number of assertions. Any more general extension must be a form that can be formalised for the proof predicate.

consts *extra_axiom* :: *fm*

6.1.9 The predicate *SubstP*, for the substitution rule

Although the substitution rule is derivable in the calculus, the derivation is too complicated to reproduce within the proof function. It is much easier to provide it as an immediate inference step, justifying its soundness in terms of other inference rules.

Definition

nominal_function *SubstP* :: *tm* ⇒ *tm* ⇒ *fm* **where**
⟦*atom u* ♯ (*p*,*q*,*v*); *atom v* ♯ (*p*,*q*)⟧ ⟹
