Abstract

This work is an effort to formalise some quantum algorithms and results in quantum information theory. Formal methods being critical for the safety and security of algorithms and protocols, we foresee their widespread use for quantum computing in the future. We have developed a large library for quantum computing in Isabelle based on a matrix representation for quantum circuits, successfully formalising the no-cloning theorem, quantum teleportation, Deutsch's algorithm, the Deutsch-Jozsa algorithm and the quantum Prisoner's Dilemma.

1.1 Basic Set-Theoretic Results

lemma *set-2-atLeast0* [simp]: $\{0..<2::nat\} = \{0,1\}$ *<proof>*

lemma *set-2*: $\{..<2::nat\} = \{0,1\}$ *<proof>*

lemma *set-4-atLeast0* [simp]: $\{0..<4::nat\} = \{0,1,2,3\}$ *<proof>*

lemma *set-4*: $\{..<4::nat\} = \{0,1,2,3\}$ *<proof>*

lemma *set-4-disj* [simp]:
 fixes $i::nat$
 assumes $i < 4$
 shows $i = 0 \vee i = 1 \vee i = 2 \vee i = 3$
 <proof>

lemma *set-8-atLeast0* [simp]: $\{0..<8::nat\} = \{0,1,2,3,4,5,6,7\}$ *<proof>*

lemma *index-is-2* [simp]: $\forall i::nat. i \neq \text{Suc } 0 \longrightarrow i \neq 3 \longrightarrow 0 < i \longrightarrow i < 4 \longrightarrow i = 2$ *<proof>*

lemma *index-sl-four* [simp]: $\forall i::nat. i < 4 \longrightarrow i = 0 \vee i = 1 \vee i = 2 \vee i = 3$ *<proof>*

1.2 Basic Arithmetic Results

lemma *index-div-eq* [simp]:
 fixes $i::nat$
 shows $i \in \{a*b..<(a+1)*b\} \implies i \text{ div } b = a$
 <proof>

lemma *index-mod-eq* [simp]:
 fixes $i::nat$
 shows $i \in \{a*b..<(a+1)*b\} \implies i \text{ mod } b = i - a*b$
 <proof>

lemma *sqr-of-cmod-of-prod*:
 shows $(\text{cmod } (z1 * z2))^2 = (\text{cmod } z1)^2 * (\text{cmod } z2)^2$
 <proof>

lemma *less-power-add-imp-div-less* [simp]:
 fixes $i m n::nat$
 assumes $i < 2^{m+n}$
 shows $i \text{ div } 2^n < 2^m$
 <proof>

lemma *div-mult-mod-eq-minus*:

fixes $i\ j::\text{nat}$
shows $(i \text{ div } 2^{\wedge}n) * 2^{\wedge}n + i \text{ mod } 2^{\wedge}n - (j \text{ div } 2^{\wedge}n) * 2^{\wedge}n - j \text{ mod } 2^{\wedge}n = i - j$
 $\langle\text{proof}\rangle$

lemma *neq-imp-neq-div-or-mod*:

fixes $i\ j::\text{nat}$
assumes $i \neq j$
shows $i \text{ div } 2^{\wedge}n \neq j \text{ div } 2^{\wedge}n \vee i \text{ mod } 2^{\wedge}n \neq j \text{ mod } 2^{\wedge}n$
 $\langle\text{proof}\rangle$

lemma *index-one-mat-div-mod*:

assumes $i < 2^{\wedge}(m+n)$ **and** $j < 2^{\wedge}(m+n)$
shows $((1_m(2^{\wedge}m) \ \S\ (i \text{ div } 2^{\wedge}n, j \text{ div } 2^{\wedge}n))::\text{complex}) * 1_m(2^{\wedge}n) \ \S\ (i \text{ mod } 2^{\wedge}n, j \text{ mod } 2^{\wedge}n) = 1_m(2^{\wedge}(m+n)) \ \S\ (i, j)$
 $\langle\text{proof}\rangle$

lemma *sqr-of-sqrt-2* [simp]:

fixes $z::\text{complex}$
shows $z * 2 / (\text{complex-of-real } (\text{sqr } 2) * \text{complex-of-real } (\text{sqr } 2)) = z$
 $\langle\text{proof}\rangle$

lemma *two-div-sqrt-two* [simp]:

shows $2 * \text{complex-of-real } (\text{sqr } (1/2)) = \text{complex-of-real } (\text{sqr } 2)$
 $\langle\text{proof}\rangle$

lemma *two-div-sqr-of-cmd-sqrt-two* [simp]:

shows $2 * (\text{cmod } (1 / \text{complex-of-real } (\text{sqr } 2)))^2 = 1$
 $\langle\text{proof}\rangle$

lemma *two-div-two* [simp]:

shows $2 \text{ div } \text{Suc } (\text{Suc } 0) = 1 \ \langle\text{proof}\rangle$

lemma *two-mod-two* [simp]:

shows $2 \text{ mod } \text{Suc } (\text{Suc } 0) = 0 \ \langle\text{proof}\rangle$

lemma *three-div-two* [simp]:

shows $3 \text{ div } \text{Suc } (\text{Suc } 0) = 1 \ \langle\text{proof}\rangle$

lemma *three-mod-two* [simp]:

shows $3 \text{ mod } \text{Suc } (\text{Suc } 0) = 1 \ \langle\text{proof}\rangle$

1.3 Basic Results on Matrices

lemma *index-matrix-prod* [simp]:

assumes $i < \text{dim-row } A$ **and** $j < \text{dim-col } B$ **and** $\text{dim-col } A = \text{dim-row } B$
shows $(A * B) \ \S\ (i, j) = (\sum_{k < \text{dim-row } B. (A \ \S\ (i, k)) * (B \ \S\ (k, j)))$
 $\langle\text{proof}\rangle$

1.4 Basic Results on Sums

lemma *sum-insert* [simp]:
 assumes $x \notin F$ **and** *finite F*
 shows $(\sum y \in \text{insert } x \ F. P \ y) = (\sum y \in F. P \ y) + P \ x$
 $\langle \text{proof} \rangle$

lemma *sum-of-index-diff* [simp]:
 fixes $f :: \text{nat} \Rightarrow 'a :: \text{comm-monoid-add}$
 shows $(\sum i \in \{a..<a+b\}. f(i-a)) = (\sum i \in \{..<b\}. f(i))$
 $\langle \text{proof} \rangle$

1.5 Basic Results Involving the Exponential Function.

lemma *exp-of-real-cnj*:
 fixes $x :: \text{real}$
 shows $\text{cnj} (\exp (i * x)) = \exp (-i * x)$
 $\langle \text{proof} \rangle$

lemma *exp-of-real-cnj2*:
 fixes $x :: \text{real}$
 shows $\text{cnj} (\exp (-(i * x))) = \exp (i * x)$
 $\langle \text{proof} \rangle$

lemma *exp-of-half-pi*:
 fixes $x :: \text{real}$
 assumes $x = \pi/2$
 shows $\exp (i * \text{complex-of-real } x) = i$
 $\langle \text{proof} \rangle$

lemma *exp-of-minus-half-pi*:
 fixes $x :: \text{real}$
 assumes $x = \pi/2$
 shows $\exp (-(i * \text{complex-of-real } x)) = -i$
 $\langle \text{proof} \rangle$

lemma *exp-of-real*:
 fixes $x :: \text{real}$
 shows $\exp (i * x) = \cos x + i * (\sin x)$
 $\langle \text{proof} \rangle$

lemma *exp-of-real-inv*:
 fixes $x :: \text{real}$
 shows $\exp (-(i * x)) = \cos x - i * (\sin x)$
 $\langle \text{proof} \rangle$

1.6 Basic Results with Trigonometric Functions.

1.6.1 Basic Inequalities

lemma *sin-squared-le-one*:

fixes $x:: \text{real}$

shows $(\sin x)^2 \leq 1$

<proof>

lemma *cos-squared-le-one*:

fixes $x:: \text{real}$

shows $(\cos x)^2 \leq 1$

<proof>

1.6.2 Basic Equalities

lemma *sin-of-quarter-pi*:

fixes $x:: \text{real}$

assumes $x = \pi/2$

shows $\sin (x/2) = (\text{sqrt } 2)/2$

<proof>

lemma *cos-of-quarter-pi*:

fixes $x:: \text{real}$

assumes $x = \pi/2$

shows $\cos (x/2) = (\text{sqrt } 2)/2$

<proof>

end

begin

3.1 Qubits

In this theory *cpx* stands for *complex*.

definition *cpx-vec-length* $::\ \text{complex } \text{vec} \Rightarrow \text{real } (\|\cdot\|)$ **where**
cpx-vec-length $v \equiv \text{sqrt}(\sum_{i < \text{dim-vec } v}. (\text{cmod } (v\ \$\ i))^2)$

lemma *cpx-length-of-vec-of-list* [*simp*]:
 $\|\text{vec-of-list } l\| = \text{sqrt}(\sum_{i < \text{length } l}. (\text{cmod } (l\ !\ i))^2)$
 $\langle \text{proof} \rangle$

lemma *norm-vec-index-unit-vec-is-0* [*simp*]:
assumes $j < n$ **and** $j \neq i$
shows $\text{cmod } ((\text{unit-vec } n\ i)\ \$\ j) = 0$
 $\langle \text{proof} \rangle$

lemma *norm-vec-index-unit-vec-is-1* [*simp*]:
assumes $j < n$ **and** $j = i$

shows $\text{cmod } ((\text{unit-vec } n \ i) \ \$ \ j) = 1$
 $\langle \text{proof} \rangle$

lemma *unit-cpx-vec-length* [simp]:
assumes $i < n$
shows $\| \text{unit-vec } n \ i \| = 1$
 $\langle \text{proof} \rangle$

lemma *smult-vec-length* [simp]:
assumes $x \geq 0$
shows $\| \text{complex-of-real}(x) \cdot_v \ v \| = x * \|v\|$
 $\langle \text{proof} \rangle$

locale *state* =
fixes $n:: \text{nat}$ **and** $v:: \text{complex mat}$
assumes *is-column* [simp]: $\text{dim-col } v = 1$
and *dim-row* [simp]: $\text{dim-row } v = 2^{\widehat{n}}$
and *is-normal* [simp]: $\| \text{col } v \ 0 \| = 1$

Below the natural number n codes for the dimension of the complex vector space whose elements of norm 1 we call states.

lemma *unit-vec-of-right-length-is-state* [simp]:
assumes $i < 2^{\widehat{n}}$
shows $\text{unit-vec } (2^{\widehat{n}}) \ i \in \{v \mid v:: \text{complex vec. dim-vec } v = 2^{\widehat{n}} \wedge \|v\| = 1\}$
 $\langle \text{proof} \rangle$

definition *state-qbit* :: $\text{nat} \Rightarrow \text{complex vec set}$ **where**
 $\text{state-qbit } n \equiv \{v \mid v:: \text{complex vec. dim-vec } v = 2^{\widehat{n}} \wedge \|v\| = 1\}$

lemma (*in state*) *state-to-state-qbit* [simp]:
shows $\text{col } v \ 0 \in \text{state-qbit } n$
 $\langle \text{proof} \rangle$

3.2 The Hermitian Conjugation

The Hermitian conjugate of a complex matrix is the complex conjugate of its transpose.

definition *dagger* :: $\text{complex mat} \Rightarrow \text{complex mat}$ (\cdot^\dagger) **where**
 $M^\dagger \equiv \text{mat } (\text{dim-col } M) (\text{dim-row } M) (\lambda(i,j). \text{cnj}(M \ \$\$ (j,i)))$

We introduce the type of complex square matrices.

typedef *cpx-sqr-mat* = $\{M \mid M:: \text{complex mat. square-mat } M\}$
 $\langle \text{proof} \rangle$

definition *cpx-sqr-mat-to-cpx-mat* :: $\text{cpx-sqr-mat} \Rightarrow \text{complex mat}$ **where**
 $\text{cpx-sqr-mat-to-cpx-mat } M \equiv \text{Rep-cpx-sqr-mat } M$

We introduce a coercion from the type of complex square matrices to the type of complex matrices.

declare [[*coercion cpx-sqr-mat-to-cpx-mat*]]

lemma *dim-row-of-dagger* [*simp*]:
 $dim\text{-row } (M^\dagger) = dim\text{-col } M$
 ⟨*proof*⟩

lemma *dim-col-of-dagger* [*simp*]:
 $dim\text{-col } (M^\dagger) = dim\text{-row } M$
 ⟨*proof*⟩

lemma *col-of-dagger* [*simp*]:
assumes $j < dim\text{-row } M$
shows $col (M^\dagger) j = vec (dim\text{-col } M) (\lambda i. cnj (M \$\$ (j, i)))$
 ⟨*proof*⟩

lemma *row-of-dagger* [*simp*]:
assumes $i < dim\text{-col } M$
shows $row (M^\dagger) i = vec (dim\text{-row } M) (\lambda j. cnj (M \$\$ (j, i)))$
 ⟨*proof*⟩

lemma *dagger-of-dagger-is-id*:
fixes $M :: complex\ Matrix.mat$
shows $(M^\dagger)^\dagger = M$
 ⟨*proof*⟩

lemma *dagger-of-sqr-is-sqr* [*simp*]:
 $square\text{-mat } ((M :: cpx\text{-sqr}\text{-mat})^\dagger)$
 ⟨*proof*⟩

lemma *dagger-of-id-is-id* [*simp*]:
 $(1_m\ n)^\dagger = 1_m\ n$
 ⟨*proof*⟩

3.3 Unitary Matrices and Quantum Gates

definition *unitary* :: *complex mat* \Rightarrow *bool* **where**
 $unitary\ M \equiv (M^\dagger) * M = 1_m (dim\text{-col } M) \wedge M * (M^\dagger) = 1_m (dim\text{-row } M)$

lemma *id-is-unitary* [*simp*]:
 $unitary (1_m\ n)$
 ⟨*proof*⟩

locale *gate* =
fixes $n :: nat$ **and** $A :: complex\ mat$
assumes *dim-row* [*simp*]: $dim\text{-row } A = 2 \hat{n}$
and *square-mat* [*simp*]: $square\text{-mat } A$
and *unitary* [*simp*]: $unitary\ A$

We prove that a quantum gate is invertible and its inverse is given by its Hermitian conjugate.

lemma *mat-unitary-mat* [*intro*]:
assumes *unitary* M
shows *inverts-mat* M (M^\dagger)
 \langle *proof* \rangle

lemma *unitary-mat-mat* [*intro*]:
assumes *unitary* M
shows *inverts-mat* (M^\dagger) M
 \langle *proof* \rangle

lemma (*in gate*) *gate-is-inv*:
invertible-mat A
 \langle *proof* \rangle

3.4 Relations Between Complex Conjugation, Hermitian Conjugation, Transposition and Unitarity

notation *transpose-mat* $((^t))$

lemma *col-tranpose* [*simp*]:
assumes *dim-row* $M = n$ **and** $i < n$
shows *col* (M^t) $i =$ *row* M i
 \langle *proof* \rangle

lemma *row-transpose* [*simp*]:
assumes *dim-col* $M = n$ **and** $i < n$
shows *row* (M^t) $i =$ *col* M i
 \langle *proof* \rangle

definition *cpx-mat-cnj* :: *complex mat* \Rightarrow *complex mat* $((^*))$ **where**
cpx-mat-cnj $M \equiv$ *mat* (*dim-row* M) (*dim-col* M) $(\lambda(i,j). \text{cnj } (M \text{ $$$ } (i,j)))$

lemma *cpx-mat-cnj-id* [*simp*]:
 $(1_m \ n)^* = 1_m \ n$
 \langle *proof* \rangle

lemma *cpx-mat-cnj-cnj* [*simp*]:
 $(M^*)^* = M$
 \langle *proof* \rangle

lemma *dim-row-of-cjn-prod* [*simp*]:
dim-row $((M^*) * (N^*)) =$ *dim-row* M
 \langle *proof* \rangle

lemma *dim-col-of-cjn-prod* [*simp*]:
dim-col $((M^*) * (N^*)) =$ *dim-col* N
 \langle *proof* \rangle

lemma *cpx-mat-cnj-prod*:

assumes $\dim\text{-col } M = \dim\text{-row } N$
shows $(M * N)^* = (M^*) * (N^*)$
 $\langle\text{proof}\rangle$

lemma *transpose-of-prod*:
fixes $M N::\text{complex Matrix.mat}$
assumes $\dim\text{-col } M = \dim\text{-row } N$
shows $(M * N)^t = N^t * (M^t)$
 $\langle\text{proof}\rangle$

lemma *transpose-cnj-is-dagger* [simp]:
 $(M^t)^* = (M^\dagger)$
 $\langle\text{proof}\rangle$

lemma *cnj-transpose-is-dagger* [simp]:
 $(M^*)^t = (M^\dagger)$
 $\langle\text{proof}\rangle$

lemma *dagger-of-transpose-is-cnj* [simp]:
 $(M^t)^\dagger = (M^*)$
 $\langle\text{proof}\rangle$

lemma *dagger-of-prod*:
fixes $M N::\text{complex Matrix.mat}$
assumes $\dim\text{-col } M = \dim\text{-row } N$
shows $(M * N)^\dagger = N^\dagger * (M^\dagger)$
 $\langle\text{proof}\rangle$

The product of two quantum gates is a quantum gate.

lemma *prod-of-gate-is-gate*:
assumes *gate* n $G1$ **and** *gate* n $G2$
shows *gate* n $(G1 * G2)$
 $\langle\text{proof}\rangle$

lemma *left-inv-of-unitary-transpose* [simp]:
assumes *unitary* U
shows $(U^t)^\dagger * (U^t) = 1_m(\dim\text{-row } U)$
 $\langle\text{proof}\rangle$

lemma *right-inv-of-unitary-transpose* [simp]:
assumes *unitary* U
shows $U^t * ((U^t)^\dagger) = 1_m(\dim\text{-col } U)$
 $\langle\text{proof}\rangle$

lemma *transpose-of-unitary-is-unitary* [simp]:
assumes *unitary* U
shows *unitary* (U^t)
 $\langle\text{proof}\rangle$

3.5 The Inner Product

We introduce a coercion between complex vectors and (column) complex matrices.

definition *ket-vec* :: *complex vec* \Rightarrow *complex mat* ($|-$) **where**
 $|v\rangle \equiv \text{mat } (\text{dim-vec } v) \ 1 \ (\lambda(i,j). v \ \$ \ i)$

lemma *ket-vec-index* [*simp*]:
assumes $i < \text{dim-vec } v$
shows $|v\rangle \ \$\$ (i,0) = v \ \$ \ i$
 $\langle \text{proof} \rangle$

lemma *ket-vec-col* [*simp*]:
 $\text{col } |v\rangle \ 0 = v$
 $\langle \text{proof} \rangle$

lemma *smult-ket-vec* [*simp*]:
 $|x \cdot_v v\rangle = x \cdot_m |v\rangle$
 $\langle \text{proof} \rangle$

lemma *smult-vec-length-bis* [*simp*]:
assumes $x \geq 0$
shows $\|\text{col } (\text{complex-of-real}(x) \cdot_m |v\rangle) \ 0\| = x * \|v\|$
 $\langle \text{proof} \rangle$

declare $[[\text{coercion } \text{ket-vec}]]$

definition *row-vec* :: *complex vec* \Rightarrow *complex mat* **where**
 $\text{row-vec } v \equiv \text{mat } 1 \ (\text{dim-vec } v) \ (\lambda(i,j). v \ \$ \ j)$

definition *bra-vec* :: *complex vec* \Rightarrow *complex mat* **where**
 $\text{bra-vec } v \equiv (\text{row-vec } v)^*$

lemma *row-bra-vec* [*simp*]:
 $\text{row } (\text{bra-vec } v) \ 0 = \text{vec } (\text{dim-vec } v) \ (\lambda i. \text{conj}(v \ \$ \ i))$
 $\langle \text{proof} \rangle$

We introduce a definition called *bra* to see a vector as a column matrix.

definition *bra* :: *complex mat* \Rightarrow *complex mat* ($\langle \cdot |$) **where**
 $\langle v| \equiv \text{mat } 1 \ (\text{dim-row } v) \ (\lambda(i,j). \text{conj}(v \ \$\$ (j,i)))$

The relation between *bra*, *bra-vec* and *ket-vec* is given as follows.

lemma *bra-bra-vec* [*simp*]:
 $\text{bra } (\text{ket-vec } v) = \text{bra-vec } v$
 $\langle \text{proof} \rangle$

lemma *row-bra* [*simp*]:
fixes $v :: \text{complex vec}$
shows $\text{row } \langle v| \ 0 = \text{vec } (\text{dim-vec } v) \ (\lambda i. \text{conj } (v \ \$ \ i))$ $\langle \text{proof} \rangle$

We introduce the inner product of two complex vectors in \mathbb{C}^n .

definition *inner-prod* :: *complex vec* \Rightarrow *complex vec* \Rightarrow *complex* ($\langle \cdot | \cdot \rangle$) **where**
inner-prod $u\ v \equiv \sum_i \langle u | e_i \rangle \cdot \langle e_i | v \rangle$

lemma *inner-prod-with-row-bra-vec* [*simp*]:

assumes $\dim\text{-vec } u = \dim\text{-vec } v$
shows $\langle u | v \rangle = \text{row } (\text{bra-vec } u) \cdot v$
 $\langle \text{proof} \rangle$

lemma *inner-prod-with-row-bra-vec-col-ket-vec* [*simp*]:

assumes $\dim\text{-vec } u = \dim\text{-vec } v$
shows $\langle u | v \rangle = (\text{row } \langle u | \ 0 \rangle) \cdot (\text{col } |v \rangle \ 0)$
 $\langle \text{proof} \rangle$

lemma *inner-prod-with-times-mat* [*simp*]:

assumes $\dim\text{-vec } u = \dim\text{-vec } v$
shows $\langle u | v \rangle = (\langle u | * |v \rangle) \ \$\$ \ (0, 0)$
 $\langle \text{proof} \rangle$

lemma *orthogonal-unit-vec* [*simp*]:

assumes $i < n$ **and** $j < n$ **and** $i \neq j$
shows $\langle \text{unit-vec } n\ i | \text{unit-vec } n\ j \rangle = 0$
 $\langle \text{proof} \rangle$

We prove that our inner product is linear in its second argument.

lemma *vec-index-is-linear* [*simp*]:

assumes $\dim\text{-vec } u = \dim\text{-vec } v$ **and** $j < \dim\text{-vec } u$
shows $(k \cdot_v u + l \cdot_v v) \ \$ \ j = k * (u \ \$ \ j) + l * (v \ \$ \ j)$
 $\langle \text{proof} \rangle$

lemma *inner-prod-is-linear* [*simp*]:

fixes $u::\text{complex vec}$ **and** $v::\text{nat} \Rightarrow \text{complex vec}$ **and** $l::\text{nat} \Rightarrow \text{complex}$
assumes $\forall i \in \{0, 1\}. \dim\text{-vec } u = \dim\text{-vec } (v\ i)$
shows $\langle u | l\ 0 \cdot_v v\ 0 + l\ 1 \cdot_v v\ 1 \rangle = (\sum_{i \leq 1}. l\ i * \langle u | v\ i \rangle)$
 $\langle \text{proof} \rangle$

lemma *inner-prod-cnj*:

assumes $\dim\text{-vec } u = \dim\text{-vec } v$
shows $\langle v | u \rangle = \text{cnj } (\langle u | v \rangle)$
 $\langle \text{proof} \rangle$

lemma *inner-prod-with-itself-Im* [*simp*]:

$\text{Im } (\langle u | u \rangle) = 0$
 $\langle \text{proof} \rangle$

lemma *inner-prod-with-itself-real* [*simp*]:

$\langle u | u \rangle \in \mathbb{R}$
 $\langle \text{proof} \rangle$

lemma *inner-prod-with-itself-eq0* [simp]:
assumes $u = 0_v$ (*dim-vec* u)
shows $\langle u|u \rangle = 0$
<proof>

lemma *inner-prod-with-itself-Re*:
Re ($\langle u|u \rangle$) ≥ 0
<proof>

lemma *inner-prod-with-itself-nonneg-reals*:
fixes $u::\text{complex vec}$
shows $\langle u|u \rangle \in \text{nonneg-Reals}$
<proof>

lemma *inner-prod-with-itself-Re-non0*:
assumes $u \neq 0_v$ (*dim-vec* u)
shows $\text{Re} (\langle u|u \rangle) > 0$
<proof>

lemma *inner-prod-with-itself-nonneg-reals-non0*:
assumes $u \neq 0_v$ (*dim-vec* u)
shows $\langle u|u \rangle \neq 0$
<proof>

lemma *cpx-vec-length-inner-prod* [simp]:
 $\|v\|^2 = \langle v|v \rangle$
<proof>

lemma *inner-prod-csqrt* [simp]:
 $\text{csqrt} \langle v|v \rangle = \|v\|$
<proof>

3.6 Unitary Matrices and Length-Preservation

3.6.1 Unitary Matrices are Length-Preserving

The bra-vector $\langle A * v|$ is given by $\langle v| * A^\dagger$

lemma *dagger-of-ket-is-bra*:
fixes $v::\text{complex vec}$
shows $(|v \rangle)^\dagger = \langle v|$
<proof>

lemma *bra-mat-on-vec*:
fixes $v::\text{complex vec}$ **and** $A::\text{complex mat}$
assumes $\text{dim-col } A = \text{dim-vec } v$
shows $\langle A * v| = \langle v| * (A^\dagger)$
<proof>

lemma *mat-on-ket*:

fixes $v::\text{complex vec}$ **and** $A::\text{complex mat}$
assumes $\text{dim-col } A = \text{dim-vec } v$
shows $A * |v\rangle = |\text{col } (A * v) \ 0\rangle$
 $\langle\text{proof}\rangle$

lemma *dagger-of-mat-on-ket*:
fixes $v::\text{complex vec}$ **and** $A::\text{complex mat}$
assumes $\text{dim-col } A = \text{dim-vec } v$
shows $(A * |v\rangle)^\dagger = \langle v | * (A^\dagger)$
 $\langle\text{proof}\rangle$

definition *col-fst* :: 'a mat \Rightarrow 'a vec **where**
 $\text{col-fst } A = \text{vec } (\text{dim-row } A) (\lambda i. A \ \$\$ (i,0))$

lemma *col-fst-is-col* [simp]:
 $\text{col-fst } M = \text{col } M \ 0$
 $\langle\text{proof}\rangle$

We need to declare *col-fst* as a coercion from matrices to vectors in order to see a column matrix as a vector.

declare
 $[[\text{coercion-delete ket-vec}]]$
 $[[\text{coercion col-fst}]]$

lemma *unit-vec-to-col*:
assumes $\text{dim-col } A = n$ **and** $i < n$
shows $\text{col } A \ i = A * |\text{unit-vec } n \ i\rangle$
 $\langle\text{proof}\rangle$

lemma *mult-ket-vec-is-ket-vec-of-mult*:
fixes $A::\text{complex mat}$ **and** $v::\text{complex vec}$
assumes $\text{dim-col } A = \text{dim-vec } v$
shows $|A * |v\rangle\rangle = A * |v\rangle$
 $\langle\text{proof}\rangle$

lemma *unitary-is-sq-length-preserving* [simp]:
assumes *unitary* U **and** $\text{dim-vec } v = \text{dim-col } U$
shows $\|U * |v\rangle\|^2 = \|v\|^2$
 $\langle\text{proof}\rangle$

lemma *col-ket-vec* [simp]:
assumes $\text{dim-col } M = 1$
shows $|\text{col } M \ 0\rangle = M$
 $\langle\text{proof}\rangle$

lemma *state-col-ket-vec*:
assumes *state 1* v
shows *state 1* $|\text{col } v \ 0\rangle$
 $\langle\text{proof}\rangle$

lemma *col-ket-vec-index* [simp]:
assumes $i < \text{dim-row } v$
shows $|\text{col } v \ 0\rangle \ \$\$ (i,0) = v \ \$\$ (i,0)$
 $\langle \text{proof} \rangle$

lemma *col-index-of-mat-col* [simp]:
assumes $\text{dim-col } v = 1$ **and** $i < \text{dim-row } v$
shows $\text{col } v \ 0 \ \$ i = v \ \$\$ (i,0)$
 $\langle \text{proof} \rangle$

lemma *unitary-is-sq-length-preserving-bis* [simp]:
assumes *unitary* U **and** $\text{dim-row } v = \text{dim-col } U$ **and** $\text{dim-col } v = 1$
shows $\|\text{col } (U * v) \ 0\|^2 = \|\text{col } v \ 0\|^2$
 $\langle \text{proof} \rangle$

A unitary matrix is length-preserving, i.e. it acts on a vector to produce another vector of the same length.

lemma *unitary-is-length-preserving-bis* [simp]:
fixes $U::\text{complex mat}$ **and** $v::\text{complex mat}$
assumes *unitary* U **and** $\text{dim-row } v = \text{dim-col } U$ **and** $\text{dim-col } v = 1$
shows $\|\text{col } (U * v) \ 0\| = \|\text{col } v \ 0\|$
 $\langle \text{proof} \rangle$

lemma *unitary-is-length-preserving* [simp]:
fixes $U::\text{complex mat}$ **and** $v::\text{complex vec}$
assumes *unitary* U **and** $\text{dim-vec } v = \text{dim-col } U$
shows $\|U * |v\rangle\| = \|v\|$
 $\langle \text{proof} \rangle$

3.6.2 Length-Preserving Matrices are Unitary

lemma *inverts-mat-sym*:
fixes $A \ B::\text{complex mat}$
assumes *inverts-mat* $A \ B$ **and** $\text{dim-row } B = \text{dim-col } A$ **and** *square-mat* B
shows *inverts-mat* $B \ A$
 $\langle \text{proof} \rangle$

lemma *sum-of-unit-vec-length*:
fixes $i \ j \ n::\text{nat}$ **and** $c::\text{complex}$
assumes $i < n$ **and** $j < n$ **and** $i \neq j$
shows $\|\text{unit-vec } n \ i + c \cdot_v \text{unit-vec } n \ j\|^2 = 1 + \text{cnj}(c) * c$
 $\langle \text{proof} \rangle$

lemma *sum-of-unit-vec-to-col*:
assumes $\text{dim-col } A = n$ **and** $i < n$ **and** $j < n$
shows $\text{col } A \ i + c \cdot_v \text{col } A \ j = A * |\text{unit-vec } n \ i + c \cdot_v \text{unit-vec } n \ j\rangle$
 $\langle \text{proof} \rangle$

lemma *inner-prod-is-sesquilinear*:

fixes $u1\ u2\ v1\ v2::\text{complex vec}$ **and** $c1\ c2\ c3\ c4::\text{complex}$ **and** $n::\text{nat}$
assumes $\text{dim-vec } u1 = n$ **and** $\text{dim-vec } u2 = n$ **and** $\text{dim-vec } v1 = n$ **and** $\text{dim-vec } v2 = n$
shows $\langle c1 \cdot_v u1 + c2 \cdot_v u2 | c3 \cdot_v v1 + c4 \cdot_v v2 \rangle = \text{cnj } (c1) * c3 * \langle u1 | v1 \rangle +$
 $\text{cnj } (c2) * c3 * \langle u2 | v1 \rangle +$
 $\langle u2 | v2 \rangle$
 $\text{cnj } (c1) * c4 * \langle u1 | v2 \rangle + \text{cnj } (c2) * c4 *$
 $\langle u2 | v2 \rangle$
 $\langle\text{proof}\rangle$

A length-preserving matrix is unitary. So, unitary matrices are exactly the length-preserving matrices.

lemma *length-preserving-is-unitary*:

fixes $U::\text{complex mat}$
assumes $\text{square-mat } U$ **and** $\forall v::\text{complex vec. dim-vec } v = \text{dim-col } U \longrightarrow \|U * v\| = \|v\|$
shows $\text{unitary } U$
 $\langle\text{proof}\rangle$

lemma *inner-prod-with-unitary-mat* [simp]:

assumes $\text{unitary } U$ **and** $\text{dim-vec } u = \text{dim-col } U$ **and** $\text{dim-vec } v = \text{dim-col } U$
shows $\langle U * |u\rangle | U * |v\rangle \rangle = \langle u | v \rangle$
 $\langle\text{proof}\rangle$

As a consequence we prove that columns and rows of a unitary matrix are orthonormal vectors.

lemma *unitary-unit-col* [simp]:

assumes $\text{unitary } U$ **and** $\text{dim-col } U = n$ **and** $i < n$
shows $\|\text{col } U\ i\| = 1$
 $\langle\text{proof}\rangle$

lemma *unitary-unit-row* [simp]:

assumes $\text{unitary } U$ **and** $\text{dim-row } U = n$ **and** $i < n$
shows $\|\text{row } U\ i\| = 1$
 $\langle\text{proof}\rangle$

lemma *orthogonal-col-of-unitary* [simp]:

assumes $\text{unitary } U$ **and** $\text{dim-col } U = n$ **and** $i < n$ **and** $j < n$ **and** $i \neq j$
shows $\langle \text{col } U\ i | \text{col } U\ j \rangle = 0$
 $\langle\text{proof}\rangle$

lemma *orthogonal-row-of-unitary* [simp]:

fixes $U::\text{complex mat}$
assumes $\text{unitary } U$ **and** $\text{dim-row } U = n$ **and** $i < n$ **and** $j < n$ **and** $i \neq j$
shows $\langle \text{row } U\ i | \text{row } U\ j \rangle = 0$
 $\langle\text{proof}\rangle$

As a consequence, we prove that a quantum gate acting on a state of a system of n qubits give another state of that same system.

lemma *gate-on-state-is-state* [*intro, simp*]:
assumes *a1:gate n A* **and** *a2:state n v*
shows *state n (A * v)*
 ⟨*proof*⟩

3.7 A Few Well-known Quantum Gates

Any unitary operation on n qubits can be implemented exactly by composing single qubits and CNOT-gates (controlled-NOT gates). However, no straightforward method is known to implement these gates in a fashion which is resistant to errors. But, the Hadamard gate, the phase gate, the CNOT-gate and the $\pi/8$ gate are also universal for quantum computations, i.e. any quantum circuit on n qubits can be approximated to an arbitrary accuracy by using only these gates, and these gates can be implemented in a fault-tolerant way.

We introduce a coercion from real matrices to complex matrices.

definition *real-to-cpx-mat*:: *real mat* \Rightarrow *complex mat* **where**
real-to-cpx-mat $A \equiv \text{mat } (\text{dim-row } A) (\text{dim-col } A) (\lambda(i,j). A \$\$ (i,j))$

Our first quantum gate: the identity matrix! Arguably, not a very interesting one though!

definition *Id* :: *nat* \Rightarrow *complex mat* **where**
Id $n \equiv 1_m (2^{\wedge}n)$

lemma *id-is-gate* [*simp*]:
gate n (Id n)
 ⟨*proof*⟩

More interesting: the Pauli matrices.

definition *X* :: *complex mat* **where**
X $\equiv \text{mat } 2 \ 2 (\lambda(i,j). \text{if } i=j \text{ then } 0 \text{ else } 1)$

Be aware that *gate n A* means that the matrix A has dimension $2^{\wedge}n * 2^{\wedge}n$. For instance, with this convention a 2×2 matrix A which is unitary satisfies *gate 1 A* but not *gate 2 A* as one might have been expected.

lemma *dagger-of-X* [*simp*]:
 $X^{\dagger} = X$
 ⟨*proof*⟩

lemma *X-inv* [*simp*]:
 $X * X = 1_m \ 2$
 ⟨*proof*⟩

lemma *X-is-gate* [*simp*]:
gate 1 X
 ⟨*proof*⟩

definition Y :: complex mat where

$Y \equiv \text{mat } 2 \ 2 \ (\lambda(i,j). \text{ if } i=j \text{ then } 0 \text{ else (if } i=0 \text{ then } -i \text{ else } i))$

lemma dagger-of- Y [simp]:

$$Y^\dagger = Y$$

<proof>

lemma Y -inv [simp]:

$$Y * Y = 1_m \ 2$$

<proof>

lemma Y -is-gate [simp]:

$$\text{gate } 1 \ Y$$

<proof>

definition Z :: complex mat where

$Z \equiv \text{mat } 2 \ 2 \ (\lambda(i,j). \text{ if } i \neq j \text{ then } 0 \text{ else (if } i=0 \text{ then } 1 \text{ else } -1))$

lemma dagger-of- Z [simp]:

$$Z^\dagger = Z$$

<proof>

lemma Z -inv [simp]:

$$Z * Z = 1_m \ 2$$

<proof>

lemma Z -is-gate [simp]:

$$\text{gate } 1 \ Z$$

<proof>

The Hadamard gate

definition H :: complex mat where

$H \equiv 1/\text{sqrt}(2) \cdot_m (\text{mat } 2 \ 2 \ (\lambda(i,j). \text{ if } i \neq j \text{ then } 1 \text{ else (if } i=0 \text{ then } 1 \text{ else } -1)))$

lemma H -without-scalar-prod:

$$H = \text{mat } 2 \ 2 \ (\lambda(i,j). \text{ if } i \neq j \text{ then } 1/\text{sqrt}(2) \text{ else (if } i=0 \text{ then } 1/\text{sqrt}(2) \text{ else } -(1/\text{sqrt}(2))))$$

<proof>

lemma dagger-of- H [simp]:

$$H^\dagger = H$$

<proof>

lemma H -inv [simp]:

$$H * H = 1_m \ 2$$

<proof>

lemma H -is-gate [simp]:

gate 1 H
 ⟨proof⟩

lemma H -values:
 fixes $i\ j::\ \text{nat}$
 assumes $i < \text{dim-row } H$ and $j < \text{dim-col } H$ and $i \neq 1 \vee j \neq 1$
 shows $H \ \$\$ (i,j) = 1/\text{sqrt } 2$
 ⟨proof⟩

lemma H -values-right-bottom:
 fixes $i\ j::\ \text{nat}$
 assumes $i = 1 \wedge j = 1$
 shows $H \ \$\$ (i,j) = -1/\text{sqrt } 2$
 ⟨proof⟩

The controlled-NOT gate

definition $CNOT$::complex mat **where**
 $CNOT \equiv \text{mat } 4\ 4$
 $(\lambda(i,j). \text{if } i=0 \wedge j=0 \text{ then } 1 \text{ else}$
 $(\text{if } i=1 \wedge j=1 \text{ then } 1 \text{ else}$
 $(\text{if } i=2 \wedge j=3 \text{ then } 1 \text{ else}$
 $(\text{if } i=3 \wedge j=2 \text{ then } 1 \text{ else } 0))))$

lemma dagger-of- $CNOT$ [simp]:
 $CNOT^\dagger = CNOT$
 ⟨proof⟩

lemma $CNOT$ -inv [simp]:
 $CNOT * CNOT = 1_m\ 4$
 ⟨proof⟩

lemma $CNOT$ -is-gate [simp]:
 gate 2 $CNOT$
 ⟨proof⟩

The phase gate, also known as the S-gate

definition S ::complex mat **where**
 $S \equiv \text{mat } 2\ 2 (\lambda(i,j). \text{if } i=0 \wedge j=0 \text{ then } 1 \text{ else } (\text{if } i=1 \wedge j=1 \text{ then } i \text{ else } 0))$

The $\pi/8$ gate, also known as the T-gate

definition T ::complex mat **where**
 $T \equiv \text{mat } 2\ 2 (\lambda(i,j). \text{if } i=0 \wedge j=0 \text{ then } 1 \text{ else } (\text{if } i=1 \wedge j=1 \text{ then } \exp(i*(\pi/4))$
 else 0))

A few relations between the Hadamard gate and the Pauli matrices

lemma HXH -is- Z [simp]:
 $H * X * H = Z$
 ⟨proof⟩

lemma *HYH-is-minusY* [simp]:

$$H * Y * H = - Y$$

<proof>

lemma *HZH-is-X* [simp]:

$$\text{shows } H * Z * H = X$$

<proof>

3.8 The Bell States

We introduce below the so-called Bell states, also known as EPR pairs (EPR stands for Einstein, Podolsky and Rosen).

definition *bell00* :: complex mat ($|\beta_{00}\rangle$) **where**

$$\text{bell00} \equiv 1/\text{sqrt}(2) \cdot_m \text{vec } 4 \ (\lambda i. \text{if } i=0 \vee i=3 \text{ then } 1 \text{ else } 0)$$

definition *bell01* :: complex mat ($|\beta_{01}\rangle$) **where**

$$\text{bell01} \equiv 1/\text{sqrt}(2) \cdot_m \text{vec } 4 \ (\lambda i. \text{if } i=1 \vee i=2 \text{ then } 1 \text{ else } 0)$$

definition *bell10* :: complex mat ($|\beta_{10}\rangle$) **where**

$$\text{bell10} \equiv 1/\text{sqrt}(2) \cdot_m \text{vec } 4 \ (\lambda i. \text{if } i=0 \text{ then } 1 \text{ else if } i=3 \text{ then } -1 \text{ else } 0)$$

definition *bell11* :: complex mat ($|\beta_{11}\rangle$) **where**

$$\text{bell11} \equiv 1/\text{sqrt}(2) \cdot_m \text{vec } 4 \ (\lambda i. \text{if } i=1 \text{ then } 1 \text{ else if } i=2 \text{ then } -1 \text{ else } 0)$$

lemma

shows *bell00-is-state* [simp]:state 2 $|\beta_{00}\rangle$ **and** *bell01-is-state* [simp]:state 2 $|\beta_{01}\rangle$

and

bell10-is-state [simp]:state 2 $|\beta_{10}\rangle$ **and** *bell11-is-state* [simp]:state 2 $|\beta_{11}\rangle$

<proof>

lemma *bell00-index* [simp]:

shows $|\beta_{00}\rangle \ \$\$ (0,0) = 1/\text{sqrt } 2$ **and** $|\beta_{00}\rangle \ \$\$ (1,0) = 0$ **and** $|\beta_{00}\rangle \ \$\$ (2,0) = 0$ **and**

$$|\beta_{00}\rangle \ \$\$ (3,0) = 1/\text{sqrt } 2$$

<proof>

lemma *bell01-index* [simp]:

shows $|\beta_{01}\rangle \ \$\$ (0,0) = 0$ **and** $|\beta_{01}\rangle \ \$\$ (1,0) = 1/\text{sqrt } 2$ **and** $|\beta_{01}\rangle \ \$\$ (2,0) = 1/\text{sqrt } 2$ **and**

$$|\beta_{01}\rangle \ \$\$ (3,0) = 0$$

<proof>

lemma *bell10-index* [simp]:

shows $|\beta_{10}\rangle \ \$\$ (0,0) = 1/\text{sqrt } 2$ **and** $|\beta_{10}\rangle \ \$\$ (1,0) = 0$ **and** $|\beta_{10}\rangle \ \$\$ (2,0) = 0$ **and**

$$|\beta_{10}\rangle \ \$\$ (3,0) = - 1/\text{sqrt } 2$$

<proof>

lemma *bell-11-index* [*simp*]:
shows $|\beta_{11}\rangle \text{ $$ } (0,0) = 0$ **and** $|\beta_{11}\rangle \text{ $$ } (1,0) = 1/\text{sqrt } 2$ **and** $|\beta_{11}\rangle \text{ $$ } (2,0) = -1/\text{sqrt } 2$ **and**
 $|\beta_{11}\rangle \text{ $$ } (3,0) = 0$
 $\langle \text{proof} \rangle$

3.9 The Bitwise Inner Product

definition *bitwise-inner-prod*:: $\text{nat} \Rightarrow \text{nat} \Rightarrow \text{nat} \Rightarrow \text{nat}$ **where**
bitwise-inner-prod $n\ i\ j = (\sum_{k \in \{0..<n\}} (\text{bin-rep } n\ i) ! k * (\text{bin-rep } n\ j) ! k)$

abbreviation *bip*:: $\text{nat} \Rightarrow \text{nat} \Rightarrow \text{nat} \Rightarrow \text{nat}$ ($- \cdot_n -$) **where**
bip $i\ n\ j \equiv \text{bitwise-inner-prod } n\ i\ j$

lemma *bitwise-inner-prod-fst-el-0*:
assumes $i < 2^n \vee j < 2^n$
shows $(i \cdot_{\text{Suc } n} j) = (i \bmod 2^n) \cdot_n (j \bmod 2^n)$
 $\langle \text{proof} \rangle$

lemma *bitwise-inner-prod-fst-el-is-1*:
fixes $n\ i\ j$:: nat
assumes $i \geq 2^n \wedge j \geq 2^n$ **and** $i < 2^{n+1} \wedge j < 2^{n+1}$
shows $(i \cdot_{n+1} j) = 1 + ((i \bmod 2^n) \cdot_n (j \bmod 2^n))$
 $\langle \text{proof} \rangle$

lemma *bitwise-inner-prod-with-zero*:
assumes $m < 2^n$
shows $(0 \cdot_n m) = 0$
 $\langle \text{proof} \rangle$

end

```

There is already a formalization of tensor products in the Archive of Formal Proofs, namely `Matrix_Tensor.thy` in `Tensor Product of Matrices`[1] by T.V.H. Prathamesh, but it does not build on top of the formalization of vectors and matrices given in `Matrices`, `Jordan Normal Forms`, and `Spectral Radius Theory`[2] by René Thiemann and Akihisa Yamada. In the present theory our purpose consists in giving such a formalization. Of course, we will reuse Prathamesh's code as much as possible, and in order to achieve that we formalize some lemmas that translate back and forth between vectors (resp. matrices) seen as lists (resp. lists of lists) and vectors (resp. matrices) as formalized in [2].

5.1 The Kronecker Product of Complex Vectors

```

definition tensor-vec:: complex Matrix.vec ⇒ complex Matrix.vec ⇒ complex Ma-
trix.vec (infixl ⊗ 63)
where tensor-vec u v ≡ vec-of-list (mult.vec-vec-Tensor (*) (list-of-vec u) (list-of-vec
v))

```

5.2 The Tensor Product of Complex Matrices

To see a matrix in the sense of [2] as a matrix in the sense of [1], we convert it into its list of column vectors.

definition *mat-to-cols-list*:: *complex Matrix.mat* \Rightarrow *complex list list* **where**
mat-to-cols-list $A = [[A \ \$\$ (i,j) . i <- [0..< dim-row A]] . j <- [0..< dim-col A]]$

lemma *length-mat-to-cols-list* [*simp*]:
length (*mat-to-cols-list* A) = *dim-col* A
 ⟨*proof*⟩

lemma *length-cols-mat-to-cols-list* [*simp*]:
assumes $j < \text{dim-col } A$
shows *length* [$A \ \$\$ (i,j) . i <- [0..< \text{dim-row } A]$] = *dim-row* A
 ⟨*proof*⟩

lemma *length-row-mat-to-cols-list* [*simp*]:
assumes $i < \text{dim-row } A$
shows *length* (*row* (*mat-to-cols-list* A) i) = *dim-col* A
 ⟨*proof*⟩

lemma *length-col-mat-to-cols-list* [*simp*]:
assumes $j < \text{dim-col } A$
shows *length* (*col* (*mat-to-cols-list* A) j) = *dim-row* A
 ⟨*proof*⟩

lemma *mat-to-cols-list-is-not-Nil* [*simp*]:
assumes $\text{dim-col } A > 0$
shows *mat-to-cols-list* $A \neq []$
 ⟨*proof*⟩

Link between *Matrix_Tensor.row_length* and *Matrix.dim_row*

lemma *row-length-mat-to-cols-list* [*simp*]:
assumes $\text{dim-col } A > 0$
shows *mult.row-length* (*mat-to-cols-list* A) = *dim-row* A
 ⟨*proof*⟩

mat-to-cols-list is a matrix in the sense of *Matrix.Matrix-Legacy*.

lemma *mat-to-cols-list-is-mat* [*simp*]:
assumes $\text{dim-col } A > 0$
shows *mat* (*mult.row-length* (*mat-to-cols-list* A)) (*length* (*mat-to-cols-list* A))
 (*mat-to-cols-list* A)
 ⟨*proof*⟩

definition *mat-of-cols-list*:: *nat* \Rightarrow *complex list list* \Rightarrow *complex Matrix.mat* **where**
mat-of-cols-list $nr \ cs = \text{Matrix.mat } nr \ (\text{length } cs) \ (\lambda (i,j). \ cs ! j ! i)$

lemma *index-mat-of-cols-list* [*simp*]:

assumes $i < nr$ **and** $j < length\ cs$

Quantum

begin

Given an element v such that *state* n v , its components $v \text{ \$ } i$ (when v is seen as a vector, v being a matrix column) for $0 \leq i < n$ have to be understood as the coefficients of the representation of v in the basis given by the unit vectors of dimension 2^n , unless stated otherwise. Such a vector v is a state for a quantum system of n qubits. In the literature on quantum computing,

for $n = 1$, i.e. for a quantum system of 1 qubit, the elements of the so-called computational basis are denoted $|0\rangle, |1\rangle$, and these last elements might be understood for instance as $(1, 0), (0, 1)$, i.e. as the zeroth and the first elements of a given basis ; for $n = 2$, i.e. for a quantum system of 2 qubits, the elements of the computational basis are denoted $|00\rangle, |01\rangle, |10\rangle, |11\rangle$, and they might be understood for instance as $(1, 0, 0, 0), (0, 1, 0, 0), (0, 0, 1, 0), (0, 0, 0, 1)$; and so on for higher values of n . The idea behind these standard notations is that the labels on the vectors of the computational basis are the binary expressions of the natural numbers indexing the elements in a given ordered basis interpreting the computational basis in a specific context, another point of view is that the order of the basis corresponds to the lexicographic order for the labels. Those labels also represent the possible outcomes of a measurement of the n qubits of the system, while the squared modules of the corresponding coefficients represent the probabilities for those outcomes. The fact that the vector v has to be normalized expresses precisely the fact that the squared modules of the coefficients represent some probabilities and hence their sum should be 1. Note that in the case of a system with multiple qubits, i.e. $n \geq 2$, one can model the simultaneous measurement of multiple qubits by sequential measurements of single qubits. Indeed, this last process leads to the same probabilities for the various possible outcomes. Given a system with n -qubits and i the index of one qubit among the n qubits of the system, where $0 \leq i \leq n - 1$ (i.e. we start the indexing from 0), we want to find the indices of the states of the computational basis whose labels have a 1 at the i th spot (counting from 0). For instance, if $n = 3$ and $i = 2$ then 1,3,5,7 are the indices of the elements of the computational basis with a 1 at the 2nd spot, namely $|001\rangle, |011\rangle, |101\rangle, |111\rangle$. To achieve that we define the predicate *select-index* below.

definition *select-index* :: $nat \Rightarrow nat \Rightarrow nat \Rightarrow bool$ **where**
select-index $n\ i\ j \equiv (i \leq n - 1) \wedge (j \leq 2^{\wedge n} - 1) \wedge (j \bmod 2^{\wedge(n-i)} \geq 2^{\wedge(n-1-i)})$

lemma *select-index-union*:

$\{k \mid k :: nat. \text{select-index } n\ i\ k\} \cup \{k \mid k :: nat. (k < 2^{\wedge n}) \wedge \neg \text{select-index } n\ i\ k\} = \{0..<2^{\wedge n} :: nat\}$
<proof>

lemma *select-index-inter*:

$\{k \mid k :: nat. \text{select-index } n\ i\ k\} \cap \{k \mid k :: nat. (k < 2^{\wedge n}) \wedge \neg \text{select-index } n\ i\ k\} = \{\}$
<proof>

lemma *outcomes-sum* [*simp*]:

fixes $f :: nat \Rightarrow real$

shows

$(\sum_{j \in \{k \mid k :: nat. \text{select-index } n\ i\ k\}. (f\ j)}) +$
 $(\sum_{j \in \{k \mid k :: nat. (k < 2^{\wedge n}) \wedge \neg \text{select-index } n\ i\ k\}. (f\ j)}) =$

$(\sum_{j \in \{0..<2^{\wedge}n::\text{nat}\}}. (f j))$
 <proof>

Given a state v of a n -qbit system, we compute the probability that a measure of qubit i has the outcome 1.

definition *prob1* :: $\text{nat} \Rightarrow \text{complex mat} \Rightarrow \text{nat} \Rightarrow \text{real}$ **where**
prob1 $n v i \equiv \sum_{j \in \{k \mid k::\text{nat}. \text{select-index } n i k\}}. (\text{cmod}(v \text{ $$ } (j,0)))^2$

definition *prob0* :: $\text{nat} \Rightarrow \text{complex mat} \Rightarrow \text{nat} \Rightarrow \text{real}$ **where**
prob0 $n v i \equiv \sum_{j \in \{k \mid k::\text{nat}. (k < 2^{\wedge}n) \wedge \neg \text{select-index } n i k\}}. (\text{cmod}(v \text{ $$ } (j,0)))^2$

assumes *state* $n v$
shows *prob0* $n v i \geq 0 \wedge \text{prob0}$ $n v i \leq 1$
 <proof>

lemma *prob1-is-prob*:

assumes *state* $n v$
shows *prob1* $n v i \geq 0 \wedge \text{prob1}$ $n v i \leq 1$
 <proof>

Below we give the new state of a n -qubits system after a measurement of the i th qubit gave 0.

definition *post-meas0* :: $\text{nat} \Rightarrow \text{complex mat} \Rightarrow \text{nat} \Rightarrow \text{complex mat}$ **where**

post-meas0 $n v i \equiv$
 $\text{of-real}(1/\text{sqrt}(\text{prob0 } n v i)) \cdot_m \text{vec } (2^{\wedge}n) (\lambda j. \text{if } \neg \text{select-index } n i j \text{ then } v \text{ $$ } (j,0) \text{ else } 0)$

Note that a division by 0 never occurs. Indeed, if $\text{sqrt}(\text{prob0 } n v i)$ would be 0 then *prob0* $n v i$ would be 0 and it would mean that the measurement of the i th qubit gave 1.

lemma *post-meas0-is-state* [*simp*]:

assumes *state* $n v$ **and** *prob0* $n v i \neq 0$
shows *state* n (*post-meas0* $n v i$)

<proof>

Below we give the new state of a n-qubits system after a measurement of the ith qubit gave 1.

definition *post-meas1* :: nat \Rightarrow complex mat \Rightarrow nat \Rightarrow complex mat **where**
post-meas1 n v i \equiv
of-real(1/sqrt(prob1 n v i)) \cdot_m |vec (2 \wedge n) (λj . if select-index n i j then v \$\$ (j,0)
else 0))

Note that a division by 0 never occurs. Indeed, if sqrt(prob1 n v i) would be 0 then prob1 n v i would be 0 and it would mean that the measurement of the ith qubit gave 0.

lemma *post-meas-1-is-state* [simp]:
assumes state n v **and** prob1 n v i \neq 0
shows state n (post-meas1 n v i)
<proof>

The measurement operator below takes a number of qubits n, a state v of a n-qubits system, a number i corresponding to the index (starting from 0) of one qubit among the n-qubits, and it computes a list whose first (resp. second) element is the pair made of the probability that the outcome of the measurement of the ith qubit is 0 (resp. 1) and the corresponding post-measurement state of the system. Of course, note that i should be strictly less than n and v should be a state of dimension n, i.e. state n v should hold".

definition *meas* :: nat \Rightarrow complex mat \Rightarrow nat \Rightarrow -list **where**
meas n v i \equiv [(prob0 n v i, post-meas0 n v i), (prob1 n v i, post-meas1 n v i)]

We want to determine the probability that the first n qubits of an n+1 qubit system are 0. For this we need to find the indices of the states of the computational basis whose labels do not have a 1 at spot $i = 0, \dots, n$.

definition *prob0-fst-qubits*:: nat \Rightarrow complex Matrix.mat \Rightarrow real **where**
prob0-fst-qubits n v \equiv
 $\sum_{j \in \{k \mid k::nat. (k < 2^{\wedge}(n+1)) \wedge (\forall i \in \{0..<n\}. \neg \text{select-index } (n+1) \ i \ k)\}}. (\text{cmod}(v \ \$\$ (j,0)))^2$

lemma *prob0-fst-qubits-index*:

fixes $n::\ \text{nat}$ **and** $v::\ \text{complex Matrix.mat}$

shows $\{k \mid k::\ \text{nat}. (k < 2^{\wedge}(n+1)) \wedge (\forall i \in \{0..<n\}. \neg \text{select-index } (n+1)\ i\ k)\} = \{0,1\}$

<proof>

lemma *prob0-fst-qubits-eq*:

fixes $n::\ \text{nat}$

shows *prob0-fst-qubits* $n\ v = (\text{cmod}(v\ \$\$ (0,0)))^2 + (\text{cmod}(v\ \$\$ (1,0)))^2$

<proof>

primrec *iter-post-meas0*:: $\text{nat} \Rightarrow \text{nat} \Rightarrow \text{complex Matrix.mat} \Rightarrow \text{complex Matrix.mat}$ **where**

iter-post-meas0 $n\ 0\ v = v$

| *iter-post-meas0* $n\ (\text{Suc } m)\ v = \text{post-meas0 } n\ (\text{iter-post-meas0 } n\ m\ v)\ m$

definition *iter-prob0*:: $\text{nat} \Rightarrow \text{nat} \Rightarrow \text{complex Matrix.mat} \Rightarrow \text{real}$ **where**

iter-prob0 $n\ m\ v = (\prod_{i < m}. \text{prob0 } n\ (\text{iter-post-meas0 } n\ i\ v)\ i)$

7.1 Measurements with Bell States

A Bell state is a remarkable state. Indeed, if one makes one measure, either of the first or the second qubit, then one gets either 0 with probability 1/2 or 1 with probability 1/2. Moreover, in the case of two successive measurements of the first and second qubit, the outcomes are correlated. Indeed, in the case of $|\beta_{00}\rangle$ or $|\beta_{10}\rangle$ (resp. $|\beta_{01}\rangle$ or $|\beta_{11}\rangle$) if one measures the second qubit after a measurement of the first qubit (or the other way around) then one gets the

same outcomes (resp. opposite outcomes), i.e. for instance the probability of measuring 0 for the second qubit after a measure with outcome 0 for the first qubit is 1 (resp. 0).

lemma *prob0-bell-fst* [*simp*]:
assumes $v = |\beta_{00}\rangle \vee v = |\beta_{01}\rangle \vee v = |\beta_{10}\rangle \vee v = |\beta_{11}\rangle$
shows $\text{prob0 } 2 \ v \ 0 = 1/2$
<proof>

lemma *prob1-bell-fst* [*simp*]:
assumes $v = |\beta_{00}\rangle \vee v = |\beta_{01}\rangle \vee v = |\beta_{10}\rangle \vee v = |\beta_{11}\rangle$
shows $\text{prob1 } 2 \ v \ 0 = 1/2$
<proof>

lemma *prob0-bell-snd* [*simp*]:
assumes $v = |\beta_{00}\rangle \vee v = |\beta_{01}\rangle \vee v = |\beta_{10}\rangle \vee v = |\beta_{11}\rangle$
shows $\text{prob0 } 2 \ v \ 1 = 1/2$
<proof>

lemma *prob1-bell-snd* [*simp*]:

10 The Deutsch Algorithm

theory *Deutsch*

imports

More-Tensor

Measurement

begin

Given a function $f : 0, 1 \mapsto 0, 1$, Deutsch's algorithm decides if this function is constant or balanced with a single $f(x)$ circuit to evaluate the function for multiple values of x simultaneously. The algorithm makes use of quantum parallelism and quantum interference.

A constant function with values in $0, 1$ returns either always 0 or always 1. A balanced function is 0 for half of the inputs and 1 for the other half.

Measurement

Basics

begin

In the 2-parameter strategic space of Eisert, Wilkens and Lewenstein [EWL], Prisoner's Dilemma ceases to pose a dilemma if quantum strategies are allowed for. Indeed, Alice and Bob both choosing to defect is no longer a Nash equilibrium. However, a new Nash equilibrium appears which is at the same time Pareto optimal. Moreover, there exists a quantum strategy which always gives reward if played against any classical strategy. Below the parameter γ can be seen as a measure of the game's entanglement. The game behaves classically if $\gamma = 0$, and for the maximally entangled case ($\gamma = 2*\pi$) the dilemma disappears as pointed out above.
