obtain ws where sequentially-consistent P ( $?E, ws$ )  $P \vdash (?E, ws) \checkmark$  by iprover
ultimately show ?thesis by blast
qed

```

**theorem** *J-consistent*:

```

assumes wf: wf-J-prog P
and hrt: heap-read-typeable hconf P
and wf-start: wf-start-state P C M vs
and ka:  $\bigcup (ka\text{-Val} \text{ ' set vs}) \subseteq \text{set start-addrs}$ 
shows  $\exists E$  ws. legal-execution P (J-E P C M vs status) (E, ws)

```

**proof** –

```

let ?E = J-E P C M vs status
interpret sc-legal ?E P using assms by (rule J-sc-legal)
from J-ex-sc-exec[OF assms]
obtain E ws where  $E \in ?E$   $P \vdash (E, ws) \checkmark$  sequentially-consistent P (E, ws) by blast
hence legal-execution P ?E (E, ws) by (rule SC-is-legal)
thus ?thesis by blast

```

qed

```

**theorem** JVM-consistent:

```

assumes wf: wf-jvm-progΦ P
and hrt: heap-read-typeable hconf P
and wf-start: wf-start-state P C M vs
and ka: ⋃ (ka-Val ‘ set vs) ⊆ set start-addr
shows ∃ E ws. legal-execution P (JVMd- $\mathcal{E}$  P C M vs status) (E, ws)

```

**proof** –

```

let ?E = JVMd- $\mathcal{E}$  P C M vs status
interpret sc-legal ?E P using assms by (rule JVM-sc-legal)
from JVM-ex-sc-exec[OF assms]
obtain E ws where E ∈ ?E P ⊢ (E, ws) ✓ sequentially-consistent P (E, ws) by blast
hence legal-execution P ?E (E, ws) by (rule SC-is-legal)
thus ?thesis by blast

```

**qed**

**end**

One could now also prove that the aggressive JVM satisfies *drf*. The key would be that *welltyped-commute* also holds for *non-speculative* prefixes from start.

**end**

## 8.16 JMM heap implementation 1

**theory** JMM-Type

**imports**

```

  ../Common/ExternalCallWF
  ../Common/ConformThreaded
  JMM-Heap

```

**begin**

### 8.16.1 Definitions

The JMM heap only stores type information.

**type-synonym**  $'addr \text{ JMM-heap} = 'addr \multimap htype$

**translations**  $(type) 'addr \text{ JMM-heap} \leq (type) 'addr \Rightarrow htype \text{ option}$

**abbreviation**  $jmm\text{-empty} :: 'addr \text{ JMM-heap} \text{ where } jmm\text{-empty} == Map.empty$

**definition**  $jmm\text{-allocate} :: 'addr \text{ JMM-heap} \Rightarrow htype \Rightarrow ('addr \text{ JMM-heap} \times 'addr) \text{ set}$   
**where**  $jmm\text{-allocate } h \ hT = (\lambda a. (h(a \mapsto hT), a)) \text{ ' } \{a. h \ a = None\}$

**definition**  $jmm\text{-typeof-addr} :: 'addr \text{ JMM-heap} \Rightarrow 'addr \multimap htype$   
**where**  $jmm\text{-typeof-addr } h = h$

**definition**  $jmm\text{-heap-read} :: 'addr \text{ JMM-heap} \Rightarrow 'addr \Rightarrow addr\text{-loc} \Rightarrow 'addr \text{ val} \Rightarrow bool$   
**where**  $jmm\text{-heap-read } h \ a \ ad \ v = True$

**context**  
**notes**  $[[inductive\text{-internals}]]$   
**begin**

**inductive**  $jmm\text{-heap-write} :: 'addr \text{ JMM-heap} \Rightarrow 'addr \Rightarrow addr\text{-loc} \Rightarrow 'addr \text{ val} \Rightarrow 'addr \text{ JMM-heap}$   
 $\Rightarrow bool$   
**where**  $jmm\text{-heap-write } h \ a \ ad \ v \ h$

**end**

**definition**  $jmm\text{-hconf} :: 'm \text{ prog} \Rightarrow 'addr \text{ JMM-heap} \Rightarrow bool \ (- \vdash jmm - \sqrt{[51,51]} \ 50)$   
**where**  $P \vdash jmm \ h \ \sqrt{\longleftrightarrow} \ ty\text{-of-} htype \text{ ' } ran \ h \subseteq \{T. is\text{-type } P \ T\}$

**definition**  $jmm\text{-allocated} :: 'addr \text{ JMM-heap} \Rightarrow 'addr \text{ set}$   
**where**  $jmm\text{-allocated } h = dom \ (jmm\text{-typeof-addr } h)$

**definition**  $jmm\text{-spurious-wakeups} :: bool$   
**where**  $jmm\text{-spurious-wakeups} = True$

**lemmas**  $jmm\text{-heap-ops-defs} =$   
 $jmm\text{-allocate-def } jmm\text{-typeof-addr-def}$   
 $jmm\text{-heap-read-def } jmm\text{-heap-write-def}$   
 $jmm\text{-allocated-def } jmm\text{-spurious-wakeups-def}$

**type-synonym**  $'addr \text{ thread-id} = 'addr$

**abbreviation**  $(input) \text{ addr2thread-id} :: 'addr \Rightarrow 'addr \text{ thread-id}$   
**where**  $\text{addr2thread-id} \equiv \lambda x. x$

**abbreviation**  $(input) \text{ thread-id2addr} :: 'addr \text{ thread-id} \Rightarrow 'addr$   
**where**  $\text{thread-id2addr} \equiv \lambda x. x$

**interpretation**  $jmm: heap\text{-base}$   
 $\text{addr2thread-id } \text{thread-id2addr}$   
 $jmm\text{-spurious-wakeups}$   
 $jmm\text{-empty } jmm\text{-allocate } jmm\text{-typeof-addr } jmm\text{-heap-read } jmm\text{-heap-write}$

.

**notation** *jmm.hex*  $(- \trianglelefteq_{jmm} - [51, 51] \ 50)$   
**notation** *jmm.conf*  $(-, - \vdash_{jmm} - : \leq - [51, 51, 51, 51] \ 50)$   
**notation** *jmm.addr-loc-type*  $(-, - \vdash_{jmm} - @ - : - [50, 50, 50, 50, 50] \ 51)$   
**notation** *jmm.confs*  $(-, - \vdash_{jmm} - [:\leq] - [51, 51, 51, 51] \ 50)$   
**notation** *jmm.tconf*  $(-, - \vdash_{jmm} - \sqrt{t} [51, 51, 51] \ 50)$

Now a variation of the JMM with a different read operation that permits to read only type-conformant values

**interpretation** *jmm'*: *heap-base*  
*addr2thread-id thread-id2addr*  
*jmm-spurious-wakeups*  
*jmm-empty jmm-allocate jmm-typeof-addr jmm.heap-read-typed P jmm-heap-write*  
**for** *P* .

**notation** *jmm'.hex*  $(- \trianglelefteq_{jmm''} - [51, 51] \ 50)$   
**notation** *jmm'.conf*  $(-, - \vdash_{jmm''} - : \leq - [51, 51, 51, 51] \ 50)$

### 9.2.1 Schedulers for deterministic small-step semantics

The default code equations for *Predicate.the* impose the type class constraint *eq* on the predicate elements. For the semantics, which contains the heap, there might be no such instance, so we use new constants for which other code equations can be used. These do not add the type class constraint, but may fail more often with non-uniqueness exception.

## 9.4 Round robin scheduler

```

theory Round-Robin
imports
  Scheduler
begin

```

A concrete scheduler must pick one possible reduction step from the small-step semantics for individual threads. Currently, this is only possible if there is only one such by using *Predicate.the*.

### 9.4.1 Concrete schedulers

### 9.4.2 Round-robin schedulers

```

### *Fields*

Problem: Does not terminate for cyclic class hierarchies! This problem already occurs in Jinja's well-formedness checker: *wf-cdecl* calls *wf-mdecl* before checking for acyclicity, but *wf-J-mdecl* involves the type judgements, which in turn requires *Fields* (via *sees-field*). Checking acyclicity before executing *Fields'* for tabulation is difficult because we would have to intertwine tabulation and well-formedness checking. Possible (local) solution: additional termination parameter (like memoisation for *rtranclp*) and list option as error return parameter.

### **inductive**

```

Fields' :: 'm cdecl list ⇒ cname ⇒ ((vname × cname) × (ty × fmod)) list ⇒ bool

## 9.8 An optimized JVM

```

theory JVMExec-Execute2
imports
  ../BV/BVNoTypeError
  ExternalCall-Execute

```

**begin**

This JVM must lookup the method declaration of the top call frame at every step to find the next instruction. It is more efficient to refine it such that the instruction list and the exception table are cached in the call frame. Even further, this theory adds keeps track of *drop pc ins*, whose head is the next instruction to execute.
