Formalization of Bachmair and Ganzinger's Ordered Resolution Prover

Anders Schlichtkrull, Jasmin Christian Blanchette, Dmitriy Traytel, and Uwe Waldmann

January 22, 2018

Abstract

This Isabelle/HOL formalization covers Sections 2 to 4 of Bachmair and Ganzinger's "Resolution Theorem Proving" chapter in the *Handbook of Automated Reasoning*. This includes soundness and completeness of unordered and ordered variants of ground resolution with and without literal selection, the standard redundancy criterion, a general framework for refutational theorem proving, and soundness and completeness of an abstract first-order prover.

15 An Ordered Resolution Prover for First-Order Clauses **90**

1 Introduction

Bachmair and Ganzinger's "Resolution Theorem Proving" chapter in the *Handbook of Automated Reasoning* is the standard reference on the topic. It defines a general framework for propositional and first-order resolution-based theorem proving. Resolution forms the basis for superposition, the calculus implemented in many popular automatic theorem provers.

This Isabelle/HOL formalization covers Sections 2.1, 2.2, 2.4, 2.5, 3, 4.1, 4.2, and 4.3 of Bachmair and Ganzinger's chapter. Section 2 focuses on preliminaries. Section 3 introduces unordered and ordered variants of ground resolution with and without literal selection and proves them refutationally complete. Section 4.1 presents a framework for theorem provers based on refutation and saturation. Finally, Section 4.2 generalizes the refutational completeness argument and introduces the standard redundancy criterion, which can be used in conjunction with ordered resolution. Section 4.3 lifts the result to a first-order prover, specified as a calculus. Figure 1 shows the corresponding Isabelle theory structure.

2 Map Function on Two Parallel Lists

theory *Map2*
imports *Main*
begin

This theory defines a map function that applies a (curried) binary function elementwise to two parallel lists.

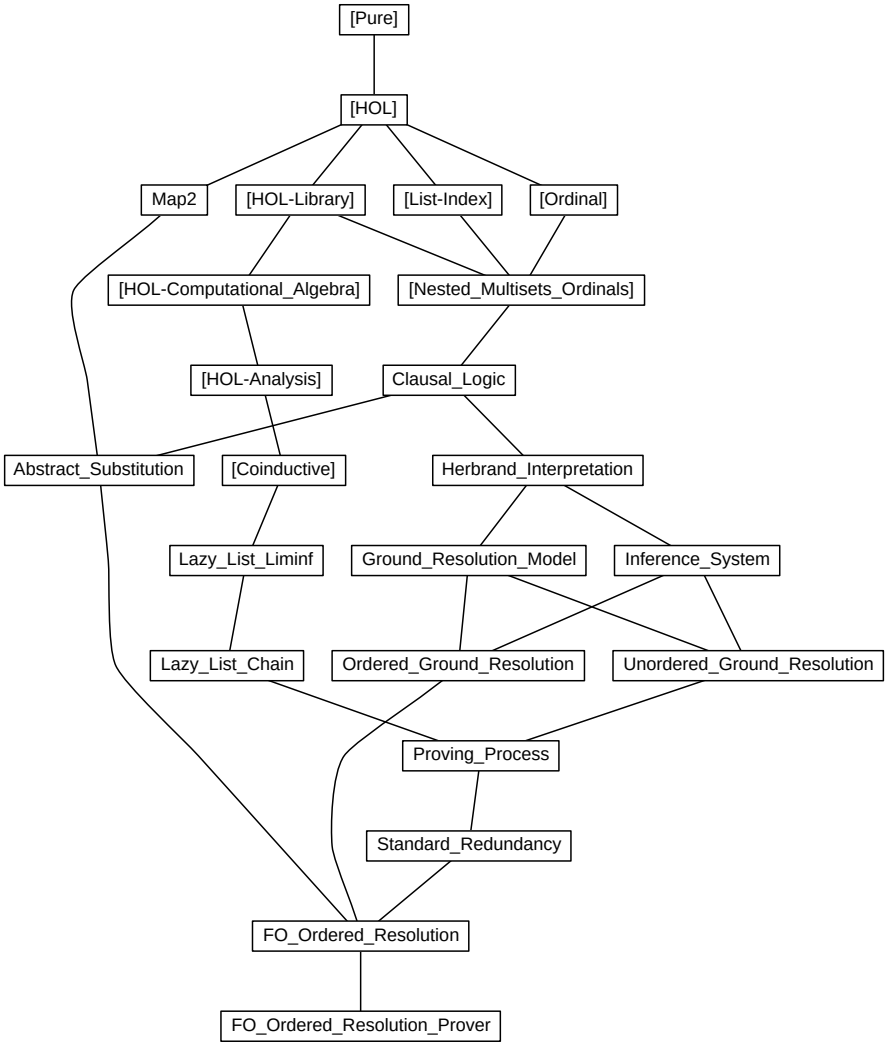

Figure 1: Theory dependency graph

The definition is taken from https://www.isa-afp.org/browser_info/current/AFP/Jinja/Listn.html.

3 Liminf of Lazy Lists

theory *Lazy_List_Liminf*
imports *Coinductive.Coinductive_List*
begin

Lazy lists, as defined in the *Archive of Formal Proofs*, provide finite and infinite lists in one type, defined coinductively. The present theory introduces the concept of the union of all elements of a lazy list of sets and the limit of such a lazy list. The definitions are stated more generally in terms of lattices. The basis for this theory is Section 4.1 (“Theorem Proving Processes”) of Bachmair and Ganzinger’s chapter.

4 Relational Chains over Lazy Lists

theory *Lazy_List_Chain*
imports *HOL*−*Library.BNF_Corec Lazy_List_Liminf*
begin

A chain is a lazy lists of elements such that all pairs of consecutive elements are related by a given relation. A full chain is either an infinite chain or a finite chain that cannot be extended. The inspiration for this theory is Section 4.1 ("Theorem Proving Processes") of Bachmair and Ganzinger's chapter.

5 Clausal Logic

```
theory Clausal_Logic
  imports Nested_Multisets_Ordinals.Multiset_More
begin
```

Resolution operates of clauses, which are disjunctions of literals. The material formalized here corresponds roughly to Sections 2.1 ("Formulas and Clauses") of Bachmair and Ganzinger, excluding the formula and term syntax.

5.1 Literals

Literals consist of a polarity (positive or negative) and an atom, of type *'a*.

```
datatype 'a literal =
  is_pos: Pos (atm_of: 'a)
| Neg (atm_of: 'a)
```

abbreviation *is_neg* :: *'a literal ⇒ bool* **where**
is_neg L ≡ ¬ is_pos L

end

context sat_preserving_inference_system
begin
```

This result surely holds, but we have yet to prove it. The challenge is: Every time a new clause is introduced, we also get a new interpretation (by the definition of *sat_preserving_inference_system*). But the interpretation we want here is then the one that exists "at the limit". Maybe we can use compactness to prove it.

```
theorem saturate_sat_preserving: satisfiable CC ⟹ satisfiable (saturate CC)
  oops
```

end

locale *sound_counterex_reducing_inference_system* =
  counterex_reducing_inference_system + *sound_inference_system*
begin

Compactness of clausal logic is stated as Theorem 3.12 for the case of unordered ground resolution. The proof below is a generalization to any sound counterexample-reducing inference system. The actual theorem will become available once the locale has been instantiated with a concrete inference system.

theorem *clausal_logic_compact*:
  fixes $N :: ('a :: wellorder)\ clause\ set$

9 Candidate Models for Ground Resolution

theory *Ground_Resolution_Model*
  imports *Herbrand_Interpretation*
begin

The proofs of refutational completeness for the two resolution inference systems presented in Section 3 ("Standard Resolution") of Bachmair and Ganzinger's chapter share mostly the same candidate model construction. The literal selection capability needed for the second system is ignored by the first one, by taking $\lambda\_.\ \{\}$ as instantiation for the S parameter.

locale *selection* =
  fixes $S :: 'a\ clause \Rightarrow 'a\ clause$
  assumes
    S_selects_subseteq: $S\ C \subseteq\#\ C$ **and**
    S_selects_neg_lits: $L \in\#\ S\ C \Longrightarrow is\_neg\ L$

locale *ground_resolution_with_selection* = *selection S*
  for $S :: ('a :: wellorder)\ clause \Rightarrow 'a\ clause$
begin

The following commands corresponds to Definition 3.14, which generalizes Definition 3.1. *production C* is denoted ε_C in the chapter; *interp C* is denoted I_C; *Interp C* is denoted I^C; and *Interp_N* is denoted I_N. The mutually recursive definition from the chapter is massaged to simplify the termination argument. The *production_unfold* lemma below gives the intended characterization.

context

14 First-Order Ordered Resolution Calculus with Selection

```
theory FO_Ordered_Resolution
  imports Abstract_Substitution Ordered_Ground_Resolution Standard_Redundancy
begin
```

This material is based on Section 4.3 ("A Simple Resolution Prover for First-Order Clauses") of Bachmair and Ganzinger's chapter. Specifically, it formalizes the ordered resolution calculus for first-order standard clauses presented in Figure 4 and its related lemmas and theorems, including soundness and Lemma 4.12 (the lifting lemma).

The following corresponds to pages 41–42 of Section 4.3, until Figure 5 and its explanation.

```
locale FO_resolution = mgu subst_atm id_subst comp_subst atm_of_atms renamings_apart mgu
  for
    subst_atm :: 'a :: wellorder ⇒ 's ⇒ 'a and
    id_subst :: 's and
    comp_subst :: 's ⇒ 's ⇒ 's and
    renamings_apart :: 'a literal multiset list ⇒ 's list and
    atm_of_atms :: 'a list ⇒ 'a and
    mgu :: 'a set set ⇒ 's option +
  fixes
    less_atm :: 'a ⇒ 'a ⇒ bool
  assumes
    less_atm_stable: less_atm A B ⟹ less_atm (A ·a σ) (B ·a σ)
```

15 An Ordered Resolution Prover for First-Order Clauses

theory *FO_Ordered_Resolution_Prover*
imports *FO_Ordered_Resolution*

begin

This material is based on Section 4.3 ("A Simple Resolution Prover for First-Order Clauses") of Bachmair and Ganzinger's chapter. Specifically, it formalizes the RP prover defined in Figure 5 and its related lemmas and theorems, including Lemmas 4.10 and 4.11 and Theorem 4.13 (completeness).
