

Pell's Equation

Manuel Eberl

May 26, 2024

Abstract

This article gives the basic theory of Pell's equation $x^2 = 1 + Dy^2$, where $D \in \mathbb{N}$ is a parameter and x, y are integer variables.

The main result that is proven is the following: If D is not a perfect square, then there exists a *fundamental solution* (x_0, y_0) that is not the trivial solution $(1, 0)$ and which generates all other solutions (x, y) in the sense that there exists some $n \in \mathbb{N}$ such that $|x| + |y|\sqrt{D} = (x_0 + y_0\sqrt{D})^n$. This also implies that the set of solutions is infinite, and it gives us an explicit and executable characterisation of all the solutions.

Based on this, simple executable algorithms for computing the fundamental solution and the infinite sequence of all non-negative solutions are also provided.

HOL-Computational-Algebra.Computational-Algebra

begin

Pell's equation has the general form $x^2 = 1 + Dy^2$ where $D \in \mathbb{N}$ is a parameter and x, y are \mathbb{Z} -valued variables. As we will see, that case where D is a perfect square is trivial and therefore uninteresting; we will therefore assume that D is not a perfect square for the most part.

Furthermore, it is obvious that the solutions to Pell's equation are symmetric around the origin in the sense that (x, y) is a solution iff $(\pm x, \pm y)$ is a solution. We will therefore mostly look at solutions (x, y) where both x and y are non-negative, since the remaining solutions are a trivial consequence of these.

Information on the material treated in this formalisation can be found in many textbooks and lecture notes, e.g. [3, 1].

2.1 Preliminary facts

lemma *gcd-int-nonpos-iff* [simp]: $\text{gcd } x (y :: \text{int}) \leq 0 \longleftrightarrow x = 0 \wedge y = 0$
 <proof>

lemma *minus-in-Ints-iff* [simp]:
 $-x \in \mathbb{Z} \longleftrightarrow x \in \mathbb{Z}$
 <proof>

A (positive) square root of a natural number is either a natural number or irrational.

lemma *nonneg-sqrt-nat-or-irrat*:
 assumes $x^2 = \text{real } a$ and $x \geq 0$
 shows $x \in \mathbb{N} \vee x \notin \mathbb{Q}$
 <proof>

A square root of a natural number is either an integer or irrational.

corollary *sqrt-nat-or-irrat*:
 assumes $x^2 = \text{real } a$
 shows $x \in \mathbb{Z} \vee x \notin \mathbb{Q}$
 <proof>

corollary *sqrt-nat-or-irrat'*:
 $\text{sqrt } (\text{real } a) \in \mathbb{N} \vee \text{sqrt } (\text{real } a) \notin \mathbb{Q}$
 <proof>

The square root of a natural number n is again a natural number iff n is a perfect square.

corollary *sqrt-nat-iff-is-square*:
 $\text{sqrt } (\text{real } n) \in \mathbb{N} \longleftrightarrow \text{is-square } n$
 <proof>

corollary *irrat-sqrt-nonsquare*: $\neg \text{is-square } n \implies \text{sqrt } (\text{real } n) \notin \mathbb{Q}$
 <proof>

2.2 The case of a perfect square

As we have noted, the case where D is a perfect square is trivial: In fact, we will show that the only solutions in this case are the trivial solutions $(x, y) = (\pm 1, 0)$ if D is a non-zero perfect square, or $(\pm 1, y)$ for arbitrary $y \in \mathbb{Z}$ if $D = 0$.

context

fixes $D :: nat$

assumes *square-D: is-square D*

begin

lemma *pell-square-solution-nat-aux:*

fixes $x y :: nat$

assumes $D > 0$ **and** $x^2 = 1 + D * y^2$

shows $(x, y) = (1, 0)$

<proof>

lemma *pell-square-solution-int-aux:*

fixes $x y :: int$

assumes $D > 0$ **and** $x^2 = 1 + D * y^2$

shows $x \in \{-1, 1\} \wedge y = 0$

<proof>

lemma *pell-square-solution-nat-iff:*

fixes $x y :: nat$

shows $x^2 = 1 + D * y^2 \iff x = 1 \wedge (D = 0 \vee y = 0)$

<proof>

lemma *pell-square-solution-int-iff:*

fixes $x y :: int$

shows $x^2 = 1 + D * y^2 \iff x \in \{-1, 1\} \wedge (D = 0 \vee y = 0)$

<proof>

end

2.3 Existence of a non-trivial solution

Let us now turn to the case where D is not a perfect square.

We first show that Pell's equation always has at least one non-trivial solution (apart from the trivial solution $(1, 0)$). For this, we first need a lemma about the existence of rational approximations of real numbers.

The following lemma states that for any positive integer s and real number x , we can find a rational approximation t / u to x with an error of most $1 / (u * s)$ where the denominator u is at most s .

lemma *pell-approximation-lemma:*

fixes $s :: nat$ **and** $x :: real$

assumes $s: s > 0$

shows $\exists u::nat. \exists t::int. u > 0 \wedge coprime\ u\ t \wedge 1 / s \in \{|t - u * x| < ..1 / u\}$
 <proof>

As a simple corollary of this, we can show that for irrational x , there is an infinite number of rational approximations t / u to x whose error is less than $1 / u^2$.

corollary *pell-approximation-corollary*:

fixes $x :: real$
assumes $x \notin \mathbb{Q}$
shows *infinite* $\{(t :: int, u :: nat). u > 0 \wedge coprime\ u\ t \wedge |t - u * x| < 1 / u\}$
 (*is infinite ?A*)
 <proof>

locale *pell* =
fixes $D :: nat$
assumes *nonsquare-D*: $\neg is-square\ D$
begin

lemma *D-gt-1*: $D > 1$
 <proof>

lemma *D-pos*: $D > 0$
 <proof>

With the above corollary, we can show the existence of a non-trivial solution. We restrict our attention to solutions (x, y) where both x and y are non-negative.

theorem *pell-solution-exists*: $\exists (x::nat) (y::nat). y \neq 0 \wedge x^2 = 1 + D * y^2$
 <proof>

2.4 Definition of solutions

We define some abbreviations for the concepts of a solution and a non-trivial solution.

definition *solution* :: $('a \times 'a :: comm-semiring-1) \Rightarrow bool$ **where**
solution = $(\lambda(a, b). a^2 = 1 + of-nat\ D * b^2)$

definition *nontriv-solution* :: $('a \times 'a :: comm-semiring-1) \Rightarrow bool$ **where**
nontriv-solution = $(\lambda(a, b). (a, b) \neq (1, 0) \wedge a^2 = 1 + of-nat\ D * b^2)$

lemma *nontriv-solution-altdef*: $nontriv-solution\ z \longleftrightarrow solution\ z \wedge z \neq (1, 0)$
 <proof>

lemma *solution-trivial-nat* [*simp, intro*]: $solution\ (Suc\ 0, 0)$
 <proof>

lemma *solution-trivial* [*simp, intro*]: $solution\ (1, 0)$

$\langle \text{proof} \rangle$

lemma *solution-uminus-left* [simp]: $\text{solution } (-x, y :: 'a :: \text{comm-ring-1}) \longleftrightarrow \text{solution } (x, y)$
 $\langle \text{proof} \rangle$

lemma *solution-uminus-right* [simp]: $\text{solution } (x, -y :: 'a :: \text{comm-ring-1}) \longleftrightarrow \text{solution } (x, y)$
 $\langle \text{proof} \rangle$

lemma *solution-0-snd-nat-iff* [simp]: $\text{solution } (a :: \text{nat}, 0) \longleftrightarrow a = 1$
 $\langle \text{proof} \rangle$

lemma *solution-0-snd-iff* [simp]: $\text{solution } (a :: 'a :: \text{idom}, 0) \longleftrightarrow a \in \{1, -1\}$
 $\langle \text{proof} \rangle$

lemma *no-solution-0-fst-nat* [simp]: $\neg \text{solution } (0, b :: \text{nat})$
 $\langle \text{proof} \rangle$

lemma *no-solution-0-fst-int* [simp]: $\neg \text{solution } (0, b :: \text{int})$
 $\langle \text{proof} \rangle$

lemma *solution-of-nat-of-nat* [simp]:
 $\text{solution } (\text{of-nat } a, \text{of-nat } b :: 'a :: \{\text{comm-ring-1}, \text{ring-char-0}\}) \longleftrightarrow \text{solution } (a, b)$
 $\langle \text{proof} \rangle$

lemma *solution-of-nat-of-nat'* [simp]:
 $\text{solution } (\text{case } z \text{ of } (a, b) \Rightarrow (\text{of-nat } a, \text{of-nat } b :: 'a :: \{\text{comm-ring-1}, \text{ring-char-0}\})) \longleftrightarrow$
 $\text{solution } z$
 $\langle \text{proof} \rangle$

lemma *solution-nat-abs-nat-abs* [simp]:
 $\text{solution } (\text{nat } |x|, \text{nat } |y|) \longleftrightarrow \text{solution } (x, y)$
 $\langle \text{proof} \rangle$

lemma *nontriv-solution-of-nat-of-nat* [simp]:
 $\text{nontriv-solution } (\text{of-nat } a, \text{of-nat } b :: 'a :: \{\text{comm-ring-1}, \text{ring-char-0}\}) \longleftrightarrow$
 $\text{nontriv-solution } (a, b)$
 $\langle \text{proof} \rangle$

lemma *nontriv-solution-of-nat-of-nat'* [simp]:
 $\text{nontriv-solution } (\text{case } z \text{ of } (a, b) \Rightarrow (\text{of-nat } a, \text{of-nat } b :: 'a :: \{\text{comm-ring-1}, \text{ring-char-0}\})) \longleftrightarrow$
 $\text{nontriv-solution } z$
 $\langle \text{proof} \rangle$

lemma *nontriv-solution-imp-solution* [dest]: $\text{nontriv-solution } z \implies \text{solution } z$

<proof>

2.5 The Pell valuation function

Solutions (x, y) have an interesting correspondence to the ring $\mathbb{Z}[\sqrt{D}]$ via the map $(x, y) \mapsto x + y\sqrt{D}$. We call this map the *Pell valuation function*. It is obvious that this map is injective, since \sqrt{D} is irrational.

definition *pell-valuation* :: *int* × *int* ⇒ *real* **where**
pell-valuation = $(\lambda(a, b). a + b * \text{sqrt } D)$

lemma *pell-valuation-nonneg* [*simp*]: *fst* $z \geq 0 \implies \text{snd } z \geq 0 \implies \text{pell-valuation } z \geq 0$
<proof>

lemma *pell-valuation-uminus-uminus* [*simp*]: *pell-valuation* $(-x, -y) = -\text{pell-valuation } (x, y)$
<proof>

lemma *pell-valuation-eq-iff* [*simp*]:
pell-valuation $z1 = \text{pell-valuation } z2 \iff z1 = z2$
<proof>

2.6 Linear ordering of solutions

Next, we show that solutions are linearly ordered w. r. t. the pointwise order on products. This means that for two different solutions (a, b) and (x, y) , we always either have $a < x$ and $b < y$ or $a > x$ and $b > y$.

lemma *solutions-linorder*:
fixes $a \ b \ x \ y :: \text{nat}$
assumes *solution* (a, b) *solution* (x, y)
shows $a \leq x \wedge b \leq y \vee a \geq x \wedge b \geq y$
<proof>

lemma *solutions-linorder-strict*:
fixes $a \ b \ x \ y :: \text{nat}$
assumes *solution* (a, b) *solution* (x, y)
shows $(a, b) = (x, y) \vee a < x \wedge b < y \vee a > x \wedge b > y$
<proof>

lemma *solutions-le-iff-pell-valuation-le*:
fixes $a \ b \ x \ y :: \text{nat}$
assumes *solution* (a, b) *solution* (x, y)
shows $a \leq x \wedge b \leq y \iff \text{pell-valuation } (a, b) \leq \text{pell-valuation } (x, y)$
<proof>

lemma *solutions-less-iff-pell-valuation-less*:
fixes $a \ b \ x \ y :: \text{nat}$
assumes *solution* (a, b) *solution* (x, y)

shows $a < x \wedge b < y \iff \text{pell-valuation } (a, b) < \text{pell-valuation } (x, y)$
 ⟨proof⟩

2.7 The fundamental solution

The *fundamental solution* is the non-trivial solution (x, y) with non-negative x and y for which the Pell valuation $x + y\sqrt{D}$ is minimal, or, equivalently, for which x and y are minimal.

definition *fund-sol* :: $\text{nat} \times \text{nat}$ **where**
fund-sol = (THE $z :: \text{nat} \times \text{nat}$. *is-arg-min* (*pell-valuation* :: $\text{nat} \times \text{nat} \Rightarrow \text{real}$) *nontriv-solution* z)

The well-definedness of this follows from the injectivity of the Pell valuation and the fact that smaller Pell valuation of a solution is smaller than that of another iff the components are both smaller.

theorem *fund-sol-is-arg-min*:
is-arg-min (*pell-valuation* :: $\text{nat} \times \text{nat} \Rightarrow \text{real}$) *nontriv-solution* *fund-sol*
 ⟨proof⟩

corollary

fund-sol-is-nontriv-solution: *nontriv-solution* *fund-sol*
and *fund-sol-minimal*:
 $\text{nontriv-solution } (a, b) \implies \text{pell-valuation } \text{fund-sol} \leq \text{pell-valuation } (\text{int } a, \text{int } b)$
and *fund-sol-minimal'*:
 $\text{nontriv-solution } (z :: \text{nat} \times \text{nat}) \implies \text{pell-valuation } \text{fund-sol} \leq \text{pell-valuation } z$
 ⟨proof⟩

lemma *fund-sol-minimal''*:
assumes *nontriv-solution* z
shows $\text{fst } \text{fund-sol} \leq \text{fst } z$ $\text{snd } \text{fund-sol} \leq \text{snd } z$
 ⟨proof⟩

2.8 Group structure on solutions

As was mentioned already, the Pell valuation function provides an injective map from solutions of Pell's equation into the ring $\mathbb{Z}[\sqrt{D}]$. We shall see now that the solutions are actually a subgroup of the multiplicative group of $\mathbb{Z}[\sqrt{D}]$ via the valuation function as a homomorphism:

- The trivial solution $(1, 0)$ has valuation 1 , which is the neutral element of $\mathbb{Z}[\sqrt{D}]^*$
- Multiplication of two solutions $a + b\sqrt{D}$ and $x + y\sqrt{D}$ leads to $\bar{x} + \bar{y}\sqrt{D}$ with $\bar{x} = xa + ybD$ and $\bar{y} = xb + ya$, which is again a solution.

- The conjugate $(x, -y)$ of a solution (x, y) is an inverse element to this multiplication operation, since $(x + y\sqrt{D})(x - y\sqrt{D}) = 1$.

definition *pell-mul* :: ('a :: comm-semiring-1 × 'a) ⇒ ('a × 'a) ⇒ ('a × 'a)
where

$$\text{pell-mul} = (\lambda(a,b) (x,y). (x * a + y * b * \text{of-nat } D, x * b + y * a))$$

definition *pell-cnj* :: ('a :: comm-ring-1 × 'a) ⇒ 'a × 'a **where**

$$\text{pell-cnj} = (\lambda(a,b). (a, -b))$$

lemma *pell-cnj-snd-0* [simp]: $\text{snd } z = 0 \implies \text{pell-cnj } z = z$
 ⟨proof⟩

lemma *pell-mul-commutes*: $\text{pell-mul } z1 \ z2 = \text{pell-mul } z2 \ z1$
 ⟨proof⟩

2.9 The different regions of the valuation function

Next, we shall explore what happens to the valuation function for solutions (x, y) for different signs of x and y :

- If $x > 0$ and $y > 0$, we have $x + y\sqrt{D} > 1$.
- If $x > 0$ and $y < 0$, we have $0 < x + y\sqrt{D} < 1$.
- If $x < 0$ and $y > 0$, we have $-1 < x + y\sqrt{D} < 0$.

- If $x < 0$ and $y < 0$, we have $x + y\sqrt{D} < -1$.

In particular, this means that we can deduce the sign of x and y if we know in which of these four regions the valuation lies.

lemma

assumes $x > 0$ $y > 0$ *solution* (x, y)
shows *pell-valuation-pos-pos*: *pell-valuation* $(x, y) > 1$
and *pell-valuation-pos-neg-aux*: *pell-valuation* $(x, -y) \in \{0 < .. < 1\}$
<proof>

assumes *solution* z *pell-valuation* $z > 1$
shows $\text{fst } z > 0 \wedge \text{snd } z > 0$
<proof>

2.10 Generating property of the fundamental solution

We now show that the fundamental solution generates the set of the (non-negative) solutions in the sense that each solution is a power of the fundamental solution. Combined with the symmetry property that (x, y) is a solution iff $(\pm x, \pm y)$ is a solution, this gives us a complete characterisation of all solutions of Pell's equation.

2.13.1 Efficient computation of powers by squaring

The following is a tail-recursive implementation of exponentiation by squaring. It works for any binary operation f that fulfils $f x (f x z) = f (f x x) z$, i. e. some weak form of associativity.

context

fixes $f :: 'a \Rightarrow 'a \Rightarrow 'a$

begin

function *efficient-power* $:: 'a \Rightarrow 'a \Rightarrow \text{nat} \Rightarrow 'a$ **where**

```

    efficient-power y x 0 = y
  | efficient-power y x (Suc 0) = f x y
  | n ≠ 0 ⇒ even n ⇒ efficient-power y x n = efficient-power y (f x x) (n div 2)
  | n ≠ 1 ⇒ odd n ⇒ efficient-power y x n = efficient-power (f x y) (f x x) (n div 2)
  ⟨proof⟩
termination ⟨proof⟩

```

lemma *efficient-power-code* [code]:

```

    efficient-power y x n =
      (if n = 0 then y
       else if n = 1 then f x y
       else if even n then efficient-power y (f x x) (n div 2)
       else efficient-power (f x y) (f x x) (n div 2))
  ⟨proof⟩

```

lemma *efficient-power-correct*:

```

    assumes  $\bigwedge x z. f x (f x z) = f (f x x) z$ 
    shows   efficient-power y x n = (f x  $\widetilde{\sim}$  n) y
  ⟨proof⟩

```

end

2.13.2 Multiplication and powers of solutions

We define versions of Pell solution multiplication and exponentiation specialised to natural numbers, both for efficiency reasons and to circumvent the problem of generating code for definitions made inside locales.

fun *pell-mul-nat* :: $\text{nat} \Rightarrow \text{nat} \times \text{nat} \Rightarrow -$ **where**

```

    pell-mul-nat D (a, b) (x, y) = (a * x + D * b * y, a * y + b * x)

```

lemma (in *pell*) *pell-mul-nat-correct* [simp]: $\text{pell-mul-nat } D = \text{pell.pell-mul } D$
 ⟨proof⟩

definition *efficient-pell-power* :: $\text{nat} \Rightarrow \text{nat} \times \text{nat} \Rightarrow \text{nat} \Rightarrow \text{nat} \times \text{nat}$ **where**
 $\text{efficient-pell-power } D z n = \text{efficient-power } (\text{pell-mul-nat } D) (1, 0) z n$

lemma *efficient-pell-power-correct* [simp]:

```

    efficient-pell-power D z n = (pell-mul-nat D z  $\widetilde{\sim}$  n) (1, 0)
  ⟨proof⟩

```

2.13.3 Finding the fundamental solution

In the following, we set up a very simple algorithm for computing the fundamental solution (x, y) . We try increasing values for y until $1 + Dy^2$ is a perfect square, which we check using an efficient square-detection algorithm. This is efficient enough to work on some interesting small examples.

Much better algorithms (typically based on the continued fraction expansion of \sqrt{D}) are available, but they are also considerably more complicated.

lemma *Discrete-sqrt-square-is-square*:
