

The Polylogarithm Function

Manuel Eberl

May 26, 2024

Abstract

This entry provides a definition of the *Polylogarithm function*, commonly denoted as $\text{Li}_s(z)$. Here, z is a complex number and s an integer parameter. This function can be defined by the power series expression $\text{Li}_s(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^s}$ for $|z| < 1$ and analytically extended to the entire complex plane, except for a branch cut on $\mathbb{R}_{\geq 1}$.

Several basic properties are also proven, such as the relationship to the Eulerian polynomials via $\text{Li}_{-k}(z) = z(1-z)^{k-1} A_k(z)$ for $k \geq 0$, the derivative formula $\frac{d}{dz} \text{Li}_s(z) = \frac{1}{z} \text{Li}_{s-1}(z)$, the relation to the “normal” logarithm via $\text{Li}_1(z) = -\ln(1-z)$, and the duplication formula $\text{Li}_s(z) + \text{Li}_s(-z) = 2^{1-s} \text{Li}_s(z^2)$.

2.1 Definition and basic properties

The principal branch of the Polylogarithm function $\text{Li}_s(z)$ is defined as

$$\text{Li}_s(z) = \sum_{k=1}^{\infty} \frac{z^k}{k^s}$$

for $|z| < 1$ and elsewhere by analytic continuation. For integer $s \leq 0$ it is holomorphic except for a pole at $z = 1$. For other values of s it is holomorphic except for a branch cut along the line $[1, \infty)$.

Special values include $\text{Li}_0(z) = \frac{z}{1-z}$ and $\text{Li}_1(z) = -\log(1-z)$.

One could potentially generalise this to arbitrary $s \in \mathbb{C}$, but this makes the analytic continuation somewhat more complicated, so we chosed not to do this at this point.

In the following, we define the principal branch of $\text{Li}_s(z)$ for integer s .

```

definition polylog :: "int  $\Rightarrow$  complex  $\Rightarrow$  complex" where
  "polylog k z =
    (if k  $\leq$  0 then z * poly (eulerian_poly (nat (-k))) z * (1 - z) powi
    (k - 1)
    else if z  $\in$  of_real ` {1..} then 0
    else (SOME f. f holomorphic_on -of_real`{1..}  $\wedge$ 
    ( $\forall z \in$  ball 0 1. f z = ( $\sum$  n. of_nat (Suc n) powi (-k)
    * z ^ Suc n))) z)"

```

```

lemma conv_radius_polylog: "conv_radius ( $\lambda$ r. of_nat r powi k :: complex)
= 1"
<proof>

```

```

lemma abs_summable_polylog:
  "norm z < 1  $\implies$  summable ( $\lambda$ r. norm (of_nat r powi k * z ^ r :: complex))"
<proof>

```

Two very central results that characterise the polylogarithm:

$$\text{Li}'_s(z) = \frac{1}{z} \text{Li}_{s-1}(z) \quad \text{and} \quad \text{Li}_s(z) = \sum_{n=1}^{\infty} \frac{z^n}{n^s} \quad \text{for } |z| < 1$$

```

theorem has_field_derivative_polylog [derivative_intros]:
  " $\wedge z. z \in$  (if k  $\leq$  0 then -{1} else -(of_real ` {1..}))  $\implies$ 
    (polylog k has_field_derivative (if z = 0 then 1 else polylog
    (k - 1) z / z)) (at z within A)"
  and sums_polylog: "norm z < 1  $\implies$  ( $\lambda$ n. of_nat (Suc n) powi (-k) * z
  ^ Suc n) sums polylog k z"
<proof>

```

```

lemma has_field_derivative_polylog' [derivative_intros]:
  assumes "(f has_field_derivative f') (at z within A)"

```

assumes "if $k \leq 0$ then $f z \neq 1$ else $\text{Im}(f z) \neq 0 \vee \text{Re}(f z) < 1$ "
shows " $(\lambda z. \text{polylog } k (f z)) \text{ has_field_derivative}$
 $(\text{if } f z = 0 \text{ then } 1 \text{ else } \text{polylog } (k-1) (f z) / f z * f')$ "
 (at z within A)"
 <proof>

lemma polylog_0 [simp]: "polylog k $0 = 0$ "
 <proof>

A simple consequence of the derivative formula is the following recurrence for Li_s via a contour integral:

$$\text{Li}_s(z) = \int_0^z \frac{1}{w} \text{Li}_{s-1}(w) dw$$

theorem polylog_has_contour_integral:
assumes " $z \notin \text{complex_of_real } \setminus (\{..-1\} \cup \{1..})$ "
shows " $(\lambda w. \text{polylog } s w / w) \text{ has_contour_integral polylog } (s + 1)$
 $z) (\text{linepath } 0 z)$ "
 <proof>

lemma sums_polylog':
 " $\text{norm } z < 1 \implies k \neq 0 \implies (\lambda n. \text{of_nat } n \text{ powi } -k * z ^ n) \text{ sums polylog}$
 $k z$ "
 <proof>

lemma polylog_altdef1:
 " $\text{norm } z < 1 \implies \text{polylog } k z = (\sum n. \text{of_nat } (\text{Suc } n) \text{ powi } -k * z ^ \text{Suc}$
 $n)$ "
 <proof>

lemma polylog_altdef2:
 " $\text{norm } z < 1 \implies k \neq 0 \implies \text{polylog } k z = (\sum n. \text{of_nat } n \text{ powi } -k * z ^ n)$ "
 <proof>

lemma polylog_at_pole: "polylog k $1 = 0$ "
 <proof>

lemma polylog_at_branch_cut: " $x \geq 1 \implies k > 0 \implies \text{polylog } k (\text{of_real } x) = 0$ "
 <proof>

lemma holomorphic_on_polylog [holomorphic_intros]:
assumes " $A \subseteq (\text{if } k \leq 0 \text{ then } \{-1\} \text{ else } \text{-of_real } \setminus \{1..})$ "
shows "polylog k holomorphic_on A "
 <proof>

lemmas holomorphic_on_polylog' [holomorphic_intros] =

holomorphic_on_compose_gen [OF _ holomorphic_on_polylog[OF order.refl],
unfolded o_def]

lemma analytic_on_polylog [analytic_intros]:
 assumes "A \subseteq (if k \leq 0 then -{1} else -of_real ` {1..})"
 shows "polylog k analytic_on A"
<proof>

lemmas analytic_on_polylog' [analytic_intros] =
 analytic_on_compose_gen [OF _ analytic_on_polylog[OF order.refl], unfolded
 o_def]

lemma continuous_on_polylog [analytic_intros]:
 assumes "A \subseteq (if k \leq 0 then -{1} else -of_real ` {1..})"
 shows "continuous_on A (polylog k)"
<proof>

lemmas continuous_on_polylog' [continuous_intros] =
 continuous_on_compose2 [OF continuous_on_polylog [OF order.refl]]

2.2 Special values

lemma polylog_neg_int_left:
 "k < 0 \implies polylog k z = z * poly (eulerian_poly (nat (-k))) z * (1
 - z) powi (k - 1)"
<proof>

lemma polylog_0_left: "polylog 0 z = z / (1 - z)"
<proof>

lemma polylog_neg1_left: "polylog (-1) x = x / (1 - x) ^ 2"
<proof>

lemma polylog_neg2_left: "polylog (-2) x = x * (1 + x) / (1 - x) ^ 3"
<proof>

lemma polylog_neg3_left: "polylog (-3) x = x * (1 + 4 * x + x²) / (1
 - x) ^ 4"
<proof>

lemma polylog_1:
 assumes "z \notin of_real ` {1..}"
 shows "polylog 1 z = -ln (1 - z)"
<proof>

lemma is_pole_polylog_1:
 assumes "k \leq 0"
 shows "is_pole (polylog k) 1"
<proof>

```

lemma zorder_polylog_1:
  assumes "k ≤ 0"
  shows "zorder (polylog k) 1 = k - 1"
  ⟨proof⟩

lemma isolated_singularity_polylog_1:
  assumes "k ≤ 0"
  shows "isolated_singularity_at (polylog k) 1"
  ⟨proof⟩

lemma not_essential_polylog_1:
  assumes "k ≤ 0"
  shows "not_essential (polylog k) 1"
  ⟨proof⟩

lemma polylog_meromorphic_on [meromorphic_intros]:
  assumes "k ≤ 0"
  shows "polylog k meromorphic_on {1}"
  ⟨proof⟩

```

2.3 Duplication formula

Lastly, we prove the following duplication formula that the polylogarithm satisfies:

$$\operatorname{Li}_s(z) + \operatorname{Li}_s(-z) = 2^{1-s} \operatorname{Li}_s(z^2)$$

The proof is a relatively simple manipulation of infinite sum that defines $\operatorname{Li}_s(z)$ for $|z| < 1$, followed by analytic continuation to its full domain.

```

theorem polylog_duplication:
  assumes "if s ≤ 0 then z ∉ {-1, 1} else z ∉ complex_of_real ` ({..-1}
  ∪ {1..})"
  shows "polylog s z + polylog s (-z) = 2 powi (1 - s) * polylog s (z^2)"
  ⟨proof⟩

```

end
