1 Preliminaries

1.1 Misc

lemma *mult-real-cpx*:

fixes *a::complex*

fixes *b::complex*

assumes *a ∈ Reals*

shows $a * (\text{Re } b) = \text{Re } (a * b)$ **using** *assms*

by (*metis Reals-cases complex.exhaust complex.sel(1) complex-of-real-mult-Complex of-real-mult*)

lemma *fct-bound*:

fixes *f::complex ⇒ real*

assumes $f(-1) + f 1 = 1$

and $0 \leq f 1$

and $0 \leq f (-1)$

shows $-1 \leq f 1 - f(-1) \wedge f 1 - f(-1) \leq 1$

proof

have $f 1 - f(-1) = 1 - f(-1) - f(-1)$ **using** *assms* **by** *simp*

also have $\dots \geq -1$ **using** *assms* **by** *simp*

finally show $-1 \leq f 1 - f(-1)$.

next

have $f(-1) - f 1 = 1 - f 1 - f 1$ **using** *assms* **by** *simp*

also have $\dots \geq -1$ **using** *assms* **by** *simp*

finally have $-1 \leq f(-1) - f 1$.

thus $f 1 - f (-1) \leq 1$ **by** *simp*

qed

lemma *fct-bound'*:

fixes *f::complex ⇒ real*

assumes $f(-1) + f 1 = 1$

and $0 \leq f 1$

and $0 \leq f (-1)$

shows $|f 1 - f(-1)| \leq 1$ **using** *assms* *fct-bound* **by** *auto*

lemma *pos-sum-1-le*:

assumes *finite I*
and $\forall i \in I. (0::real) \leq f i$
and $(\sum_{i \in I} f i) = 1$
and $j \in I$
shows $f j \leq 1$
proof (*rule ccontr*)
assume $\neg f j \leq 1$
hence $1 < f j$ **by** *simp*
hence $1 < (\sum_{i \in I} f i)$ **using** *assms* **by** (*metis* $\langle \neg f j \leq 1 \rangle$ *sum-nonneg-leq-bound*)

thus *False* **using** *assms* **by** *simp*
qed

lemma *last-subset*:
assumes $A \subseteq \{a, b\}$
and $a \neq b$
and $A \neq \{a, b\}$
and $A \neq \{\}$
and $A \neq \{a\}$
shows $A = \{b\}$ **using** *assms* **by** *blast*

lemma *disjoint-Un*:
assumes *disjoint-family-on A (insert x F)*
and $x \notin F$
shows $(A x) \cap (\bigcup_{a \in F} A a) = \{\}$
proof –
have $(A x) \cap (\bigcup_{a \in F} A a) = (\bigcup_{i \in F} (A x) \cap A i)$ **using** *Int-UN-distrib* **by** *simp*
also have $\dots = (\bigcup_{i \in F} \{\})$ **using** *assms disjoint-family-onD* **by** *fastforce*
also have $\dots = \{\}$ **using** *SUP-bot-conv(2)* **by** *simp*
finally show *?thesis* .
qed

lemma *sum-but-one*:
assumes $\forall j < (n::nat). j \neq i \longrightarrow f j = (0::'a::ring)$
and $i < n$
shows $(\sum_{j \in \{0 ..< n\}} f j * g j) = f i * g i$
proof –
have $sum (\lambda x. f x * g x) ((\{0 ..< n\} - \{i\}) \cup \{i\}) = sum (\lambda x. f x * g x) (\{0 ..< n\} - \{i\}) +$

3 Projective measurements

In this part we define projective measurements, also referred to as von Neumann measurements. The latter are characterized by a set of orthogonal projectors, which are used to compute the probabilities of measurement outcomes and to represent the state of the system after the measurement.

The state of the system (a density operator in this case) after a measurement is represented by the `density_collapse` function.

3.1 First definitions

We begin by defining a type synonym for couples of measurement values (reals) and the associated projectors (complex matrices).

```

type-synonym measure-outcome = real × complex Matrix.mat

```

The corresponding values and projectors are retrieved thanks to `meas_outcome_val` and `meas_outcome_prj`.

```

definition meas-outcome-val::measure-outcome ⇒ real where
  meas-outcome-val  $M_i = \text{fst } M_i$ 

```

```

definition meas-outcome-prj::measure-outcome ⇒ complex Matrix.mat where
  meas-outcome-prj  $M_i = \text{snd } M_i$ 

```

We define a predicate for projective measurements. A projective measurement is characterized by the number p of possible measure outcomes, and a function M mapping outcome i to the corresponding `measure_outcome`.

definition (in `cpx-sq-mat`) `proj-measurement::nat ⇒ (nat ⇒ measure_outcome) ⇒ bool` **where**

```

proj-measurement n M ←→
  (inj-on (λi. meas-outcome-val (M i)) {.. $n$ }) ∧
  (∀ j < n. meas-outcome-prj (M j) ∈ fc-mats ∧
   projector (meas-outcome-prj (M j))) ∧
  (∀ i < n. ∀ j < n. i ≠ j →
   meas-outcome-prj (M i) * meas-outcome-prj (M j) = 0m dimR dimR) ∧
  sum-mat (λj. meas-outcome-prj (M j)) {.. $n$ } = 1m dimR

```

lemma (in `cpx-sq-mat`) `proj-measurement-inj`:
assumes `proj-measurement p M`
shows `inj-on (λi. meas-outcome-val (M i)) {.. p }` **using** `assms`
unfolding `proj-measurement-def` **by** `simp`

lemma (in `cpx-sq-mat`) `proj-measurement-carrier`:

3.2 Measurements with observables

It is standard in quantum mechanics to represent projective measurements with so-called *observables*. These are Hermitian matrices which encode projective measurements as follows: the eigenvalues of an observable represent the possible projective measurement outcomes, and the associated projectors are the projectors onto the corresponding eigenspaces. The results in this part are based on the spectral theorem, which states that any Hermitian matrix admits an orthonormal basis consisting of eigenvectors of the matrix.

3.2.1 On the diagonal elements of a matrix

We begin by introducing definitions that will be used on the diagonalized version of a Hermitian matrix.

definition *diag-elems* where

$\text{diag-elems } B = \{B\$(i, i) \mid i. i < \text{dim-row } B\}$

Relationship between `diag_elems` and the list `diag_mat`

lemma *diag-elems-set-diag-mat*:

shows $\text{diag-elems } B = \text{set } (\text{diag-mat } B)$ **unfolding** *diag-mat-def* *diag-elems-def*

proof

show $\{B\$(i, i) \mid i. i < \text{dim-row } B\} \subseteq \text{set } (\text{map } (\lambda i. B\$(i, i)) [0..<\text{dim-row } B])$

proof

fix x

assume $x \in \{B\$(i, i) \mid i. i < \text{dim-row } B\}$

hence $\exists i < \text{dim-row } B. x = B\(i, i) **by** *auto*

from *this* **obtain** i **where** $i < \text{dim-row } B$ **and** $x = B\$(i, i)$ **by** *auto*

thus $x \in \text{set } (\text{map } (\lambda i. B\$(i, i)) [0..<\text{dim-row } B])$ **by** *auto*

qed

next

show $\text{set } (\text{map } (\lambda i. B\$(i, i)) [0..<\text{dim-row } B]) \subseteq \{B\$(i, i) \mid i. i < \text{dim-row } B\}$

proof

fix x

assume $x \in \text{set } (\text{map } (\lambda i. B\$(i, i)) [0..<\text{dim-row } B])$

thus $x \in \{B\$(i, i) \mid i. i < \text{dim-row } B\}$ **by** *auto*

qed

qed

lemma *diag-elems-finite[simp]*:

shows *finite* $(\text{diag-elems } B)$ **unfolding** *diag-elems-def* **by** *simp*

lemma *diag-elems-mem[simp]*:

assumes $i < \text{dim-row } B$

shows $B \$(i,i) \in \text{diag-elems } B$ **using** *assms* **unfolding** *diag-elems-def* **by** *auto*

When x is a diagonal element of B , `diag_elem_indices` returns the set of diagonal indices of B with value x .

definition *diag-elem-indices* **where**

diag-elem-indices $x B = \{i \mid i. i < \text{dim-row } B \wedge B \$(i,i) = x\}$

lemma *diag-elem-indices-elim*:

assumes $a \in \text{diag-elem-indices } x B$

shows $a < \text{dim-row } B \wedge B \$(a,a) = x$ **using** *assms* **unfolding** *diag-elem-indices-def* **by** *simp*

lemma *diag-elem-indices-itself*:

assumes $i < \text{dim-row } B$

shows $i \in \text{diag-elem-indices } (B \$(i,i)) B$ **using** *assms* **unfolding** *diag-elem-indices-def* **by** *simp*

lemma *diag-elem-indices-finite*:

shows *finite* (*diag-elem-indices* $x B$) **unfolding** *diag-elem-indices-def* **by** *simp*

We can therefore partition the diagonal indices of a matrix B depending on the value of the diagonal elements. If B admits p elements on its diagonal, then we define bijections between its set of diagonal elements and the initial segment $[0..p - 1]$.

3.2.2 Construction of measurement outcomes

The construction of a projective measurement for a hermitian matrix A is based on the Schur decomposition $A = U * B * U^\dagger$, where B is diagonal and U is unitary. The columns of U are normalized and pairwise orthogonal; they are used to construct the projectors associated with a measurement value

4 The CHSH inequality

The local hidden variable assumption for quantum mechanics was developed to make the case that quantum theory was incomplete. In this part we formalize the CHSH inequality, which provides an upper-bound of a quantity involving expectations in a probability space, and exploit this inequality to show that the local hidden variable assumption does not hold.

4.1 Inequality statement

lemma *chsh-real*:

fixes $A0::real$

assumes $|A0 * B1| \leq 1$

and $|A0 * B0| \leq 1$

and $|A1 * B0| \leq 1$

and $|A1 * B1| \leq 1$

shows $|A0 * B1 - A0 * B0 + A1 * B0 + A1*B1| \leq 2$

proof –

The local hidden variable assumption states that separated quantum measurements are independent. It is standard for this assumption to be stated in a context where the hidden variable admits a density; it is stated here in a more general context involving expectations, with no assumption on the existence of a density.

4.2 Properties of specific observables

In this part we consider a specific density operator and specific observables corresponding to joint bipartite measurements. We will compute the quantum expectation value of this system and prove that it violates the CHSH inequality, thus proving that the local hidden variable assumption cannot hold.

4.2.2 The X and Z matrices and two of their combinations

In this part we prove properties of two standard matrices in quantum theory, X and Z , as well as two of their combinations: $\frac{X+Z}{\sqrt{2}}$ and $\frac{Z-X}{\sqrt{2}}$. Note that all of these matrices are observables, they will be used to violate the CHSH inequality.
