

# Promela Formalization

By René Neumann

February 23, 2021

## **Abstract**

We present an executable formalization of the language Promela, the description language for models of the model checker SPIN. This formalization is part of the work for a completely verified model checker (CAVA), but also serves as a useful (and executable!) description of the semantics of the language itself, something that is currently missing. The formalization uses three steps: It takes an abstract syntax tree generated from an SML parser, removes syntactic sugar and enriches it with type information. This further gets translated into a transition system, on which the semantic engine (read: successor function) operates.

# 1 Introduction

Promela [1] is a modeling language, mainly used in the model checker SPIN [2]. It offers a C-like syntax and allows to define processes to be run concurrently. Those processes can communicate via shared global variables or by message-passing via channels. Inside a process, constructs exist for non-deterministic choice, starting other processes and enforcing atomicity. It furthermore allows different means for specifying properties: LTL formulae, assertions in the code, never claims (i. e. an automata that explicitly specifies unwanted behavior) and others.

Some constructs found in Promela models, like `#include` and `#define`, are not part of the language Promela itself, but belong to the language of the C preprocessor. SPIN does not process those, but calls the C compiler internally to process them. We do not deal with them here, but also expect the sources to be preprocessed.

Observing the output of SPIN and examining the generated graphs often is the only way of determining the semantics of a certain construct. This is complicated further by SPIN unconditionally applying optimizations. For the current formalization we chose to copy the semantics of SPIN, including the aforementioned optimizations. For some constructs, we had to restrict the semantics, i. e. some models are accepted by SPIN, but not by this formalization. Those deviations are:

- `run` is a statement instead of an expression. SPIN here has a complicated set of restrictions unto where `run` can occur inside an expression. The sole use of it is to be able to get the ID of a spawned process. We omitted this feature to guarantee expressions to be free of side-effects.
- Variable declarations which got jumped over are seen as not existing. In SPIN, such constructs show surprising behavior:  
`int i; goto L; i = 5; L: printf("%d", i)` yields 0, while  
`goto L; int i = 5; L: printf("%d", i)` yields 5.  
The latter is forbidden in our formalization (it will get rejected with “unknown variable i”), while the first behaves as in SPIN.
- Violating an `assert` does not abort, but instead sets the variable `__assert__` to true. This needs to be checked explicitly in the LTL formula. We plan on adding this check in an automatic manner.
- Types are bounded. Except for well-defined types like booleans, overflow is not allowed and will result in an error. The same holds for assigning a value that is outside the bounds. SPIN does not specify any explicit semantics here, but solely refers to the underlying C-compiler and its semantics. This might result in two models behaving differently on different systems when run with SPIN, while this formalization, due to the explicit bounds in the semantics, is not affected.

Additionally, some constructs are currently not supported, and the compilation will abort if they are encountered: `d_step`<sup>1</sup>, `typedef`, remote references, bit-operations, `unsigned`, and property specifications except `ltl` and `assert`. Other constructs are accepted but ignored, because they do not change the behavior of a model: advanced variable scoping, `xr`, `xs`, `print*`, priorities, and visibility of variables.

Nonetheless, for models not using those unsupported constructs, we generate the very same number of states as SPIN does. An exception applies for large `goto` chains and when simultaneous termination of multiple processes is involved, as SPIN's semantics is too vague here.

## 2 Abstract Syntax Tree

```
theory PromelaAST
imports Main
begin
```

The abstract syntax tree is generated from the handwritten SML parser. This theory only mirrors the data structures from the SML level to make them available in Isabelle.

```
context
begin
```

```
<ML>
```

```
datatype binOp =
  BinOpAdd

  PromelaAST
  HOL-Library.IArray
  Deriving.Compare-Instances
  CAVA-Base.CAVA-Code-Target

```

begin

### 3.1 Abstract Syntax Tree *after* preprocessing

From the plain AST stemming from the parser, we'd like to have one containing more information while also removing duplicated constructs. This is achieved in the preprocessing step.

The additional information contains:

- variable type (including whether it represents a channel or not)
- global vs local variable

Also certain constructs are expanded (like for-loops) or different nodes in the AST are collapsed into one parametrized node (e.g. the different send-operations).

This preprocessing phase also tries to detect certain static errors and will bail out with an exception if such is encountered.

```
datatype binOp = BinOpAdd
  | BinOpSub
  | BinOpMul
  | BinOpDiv
  | BinOpMod
  | BinOpGr
  | BinOpLe
  | BinOpGEq
  | BinOpLEq
  | BinOpEq
  | BinOpNEq
  | BinOpAnd
  | BinOpOr

datatype unOp = UnOpMinus
  | UnOpNeg

datatype expr = ExprBinOp binOp expr expr
  | ExprUnOp unOp expr
  | ExprCond expr expr expr
  | ExprLen chanRef
  | ExprVarRef varRef
  | ExprConst integer
  | ExprMConst integer String.literal
  | ExprTimeOut
  | ExprFull chanRef
  | ExprEmpty chanRef
  | ExprPoll chanRef recvArg list bool
```

```

and varRef = VarRef bool
                String.literal
                expr option
and chanRef = ChanRef varRef — explicit type for channels
and recvArg = RecvArgVar varRef
                | RecvArgEval expr
                | RecvArgConst integer
                | RecvArgMConst integer String.literal

```

```

datatype varType = VTBounded integer integer
                | VTChan

| StepSkip
```

```
datatype proc = ProcType (integer option) option
                String.literal
                procArg list
                varDecl list
                step list
| Init varDecl list step list
```

```
type-synonym ltl = — name: String.literal × — formula: String.literal
type-synonym promela = varDecl list × proc list × ltl list
```

### 3.2 Preprocess the AST of the parser into our variant

We setup some functionality for printing warning or even errors.

All those constants are logically *undefined*, but replaced by the parser for something meaningful.

#### consts

```
warn :: String.literal ⇒ unit
```

```
abbreviation with-warn msg e ≡ let - = warn msg in e
```

```
abbreviation the-warn opt msg ≡ case opt of None ⇒ () | - ⇒ warn msg
```

```
usc: "Unsupported Construct"
```

```
definition [code del]: usc (c :: String.literal) ≡ undefined
```

```
definition [code del]: err (e :: String.literal) = undefined
```

```
abbreviation errv e v ≡ err (e + v)
```

```
definition [simp, code del]: abort (msg :: String.literal) f = f ()
```

```
abbreviation abortv msg v f ≡ abort (msg + v) f
```

#### code-printing

```
code-module PromelaUtils ↪ (SML) ⟨
  structure PromelaUtils = struct
    exception UnsupportedConstruct of string
    exception StaticError of string
    exception RuntimeError of string
    fun warn msg = TextIO.print (Warning: ^ msg ^ \n)
    fun usc c = raise (UnsupportedConstruct c)
    fun err e = raise (StaticError e)
    fun abort msg - = raise (RuntimeError msg)
  end⟩
```

```
| constant warn ↪ (SML) PromelaUtils.warn
```

```
| constant usc ↪ (SML) PromelaUtils.usc
```

```
| constant err ↪ (SML) PromelaUtils.err
```

```
| constant abort ↪ (SML) PromelaUtils.abort
```

**code-reserved** *SML PromelaUtils*

$\langle ML \rangle$

The preprocessing is done for each type on its own.

```
primrec ppBinOp :: AST.binOp  $\Rightarrow$  binOp
where
  ppBinOp AST.BinOpAdd = BinOpAdd
| ppBinOp AST.BinOpSub = BinOpSub

Some preprocessing functions enrich the *var-data* argument and hence return a new updated one. When chaining multiple calls to such functions after another, we need to make sure, the *var-data* is passed accordingly. *cvm-fold* does exactly that for such a function *g* and a list of nodes *ss*.

**definition** *cvm-fold* **where**

### 3.3 The transition system

The edges in our transition system consist of a condition (evaluated under the current environment) and an effect (modifying the current environment). Further they may be atomic, i. e. a whole row of such edges is taken before yielding a new state. Additionally, they carry a priority: the edges are checked from highest to lowest priority, and if one edge on a higher level can be taken, the lower levels are ignored.

The states of the system do not carry any information.

```
datatype edgeCond = ECElse
  | ECTrue
  | ECFalse
  | ECExpr expr
  | ECRun String.literal
  | ECSend chanRef
  | ECRecv chanRef recvArg list bool
```

```
datatype edgeEffect = EEEnd
  | EEId
  | EEGoto
  | EEAssert expr
  | EEAssign varRef expr
  | EEDecl procVarDecl
  | EERun String.literal expr list
  | EESend chanRef expr list bool
  | EERecv chanRef recvArg list bool bool
```

```
datatype edgeIndex = Index nat | LabelJump String.literal nat option
```

```
datatype edgeAtomic = NonAtomic | Atomic | InAtomic
```

```
record edge =
  cond :: edgeCond
  effect :: edgeEffect
  target :: edgeIndex
  prio :: integer
  atomic :: edgeAtomic
```

```
definition isAtomic :: edge ⇒ bool where
  isAtomic e = (case atomic e of Atomic ⇒ True | - ⇒ False)
```

```
definition inAtomic :: edge ⇒ bool where
  inAtomic e = (case atomic e of NonAtomic ⇒ False | - ⇒ True)
```

### 3.4 State

```

## 4 Invariants for Promela data structures

```

theory PromelaInvariants
imports PromelaDatastructures
begin

```

The different data structures used in the Promela implementation require different invariants, which are specified in this file. As there is no (useful) way of specifying *correctness* of the implementation, those invariants are tailored towards proving the finiteness of the generated state-space.

```

⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩⟨proof⟩

```

### 4.1 Bounds

Finiteness requires that possible variable ranges are finite, as is the maximum number of processes. Currently, they are supplied here as constants. In a perfect world, they should be able to be set dynamically.

```

definition min-var-value :: integer where
  min-var-value = -(231)
definition max-var-value :: integer where
  max-var-value = (231) - 1

```

```

lemma min-max-var-value-simps [simp, intro!]:
  min-var-value < max-var-value
  min-var-value < 0
  min-var-value ≤ 0
  max-var-value > 0
  max-var-value ≥ 0
⟨proof⟩

```

```

definition max-procs ≡ 255
definition max-channels ≡ 65535
definition max-array-size = 65535

```

### 4.2 Variables and similar

```

fun varType-inv :: varType ⇒ bool where

 $\quad ((processes\ prog) !! pState.idx\ p)$   
 $\quad (pState.vars\ p)$

**lemma**  $pStates\text{-}finite$ :

$finite\ (Collect\ (pState\text{-}inv\ prog))$   
 $\langle proof \rangle$

Throughout the calculation of the semantic engine, a modified process is not necessarily part of  $procs\ g$ . Hence we need to establish an additional constraint for the relation between a global and a process state.

**definition**  $cl\text{-}inv :: ('a\ gState\text{-}scheme * pState) \Rightarrow bool$  **where**

$cl\text{-}inv\ gp = (case\ gp\ of\ (g,p) \Rightarrow$   
 $length\ (pState.channels\ p) \leq length\ (gState.channels\ g))$

**lemma**  $cl\text{-}inv\text{-}lengthD$ :

$cl\text{-}inv\ (g,p) \Longrightarrow length\ (pState.channels\ p) \leq length\ (gState.channels\ g)$   
 $\langle proof \rangle$

**lemma**  $cl\text{-}invI$ :

$length\ (pState.channels\ p) \leq length\ (gState.channels\ g) \Longrightarrow cl\text{-}inv\ (g,p)$   
 $\langle proof \rangle$

**lemma**  $cl\text{-}inv\text{-}trans$ :

$length\ (channels\ g) \leq length\ (channels\ g') \Longrightarrow cl\text{-}inv\ (g,p) \Longrightarrow cl\text{-}inv\ (g',p)$   
 $\langle proof \rangle$

**lemma**  $cl\text{-}inv\text{-}vars\text{-}update[intro!]$ :

$cl\text{-}inv\ (g,p) \Longrightarrow cl\text{-}inv\ (g,\ pState.vars\text{-}update\ vs\ p)$   
 $cl\text{-}inv\ (g,p) \Longrightarrow cl\text{-}inv\ (gState.vars\text{-}update\ vs\ g,\ p)$   
 $\langle proof \rangle$

**lemma**  $cl\text{-}inv\text{-}handshake\text{-}update[intro!]$ :

$cl\text{-}inv\ (g,p) \Longrightarrow cl\text{-}inv\ (g(\handshake := h),p)$   
 $\langle proof \rangle$

**lemma**  $cl\text{-}inv\text{-}hsdata\text{-}update[intro!]$ :

$cl\text{-}inv\ (g,p) \Longrightarrow cl\text{-}inv\ (g(hsdata := h),p)$   
 $\langle proof \rangle$

**lemma** *cl-inv-procs-update*[intro]:  
 $cl\text{-inv } (g,p) \implies cl\text{-inv } (g(\backslash\text{procs} := ps),p)$   
 ⟨proof⟩

**lemma** *cl-inv-channels-update*:  
**assumes**  $cl\text{-inv } (g,p)$   
**shows**  $cl\text{-inv } (gState.channels\text{-update } (\lambda cs. cs[i:=c]) g, p)$   
 ⟨proof⟩

#### 4.4 Invariants of the global state

Note that *gState-inv* must be defined in a way to be applicable to both *gState* and *gState<sub>I</sub>*.

**definition** *gState-inv* :: *program*  $\implies$  'a *gState-scheme*  $\implies$  *bool* **where**  
 $gState\text{-inv } prog\ g$   
 $\iff length\ (procs\ g) \leq max\text{-procs}$   
 $\wedge (\forall p \in set\ (procs\ g). pState\text{-inv } prog\ p \wedge cl\text{-inv } (g,p))$   
 $\wedge length\ (channels\ g) \leq max\text{-channels}$   
 $\wedge set\ (channels\ g) \subseteq Collect\ channel\text{-inv}$   
 $\wedge lm.ball\ (vars\ g)\ (\lambda(k,v). variable\text{-inv } v)$

The set of global states adhering to the terms of *gState-inv* is not finite. But the set of all global states that can be constructed by the semantic engine from one starting state is. Thus we establish a progress relation, i. e. all successors of a state *g* relate to *g* under this specification.

**definition** *gState-progress-rel* :: *program*  $\implies$  ('a *gState-scheme*) *rel* **where**  
 $gState\text{-progress-rel } p = \{(g,g'). gState\text{-inv } p\ g \wedge gState\text{-inv } p\ g'$   
 $\wedge length\ (channels\ g) \leq length\ (channels\ g')$   
 $\wedge dom\ (lm.\alpha\ (vars\ g)) = dom\ (lm.\alpha\ (vars\ g'))\}$

**lemma** *gState-progress-rel-gState-invI1*[intro]:  
 $(g,g') \in gState\text{-progress-rel } prog \implies gState\text{-inv } prog\ g$   
 ⟨proof⟩

**lemma** *gState-progress-rel-gState-invI2*[intro]:  
 $(g,g') \in gState\text{-progress-rel } prog \implies gState\text{-inv } prog\ g'$   
 ⟨proof⟩

**lemma** *gState-progress-relI*:  
**assumes**  $gState\text{-inv } prog\ g$   
**and**  $gState\text{-inv } prog\ g'$   
**and**  $length\ (channels\ g) \leq length\ (channels\ g')$   
**and**  $dom\ (lm.\alpha\ (vars\ g)) = dom\ (lm.\alpha\ (vars\ g'))$   
**shows**  $(g,g') \in gState\text{-progress-rel } prog$   
 ⟨proof⟩

**lemma** *gState-progress-refl*[simp,intro]:

$gState\text{-}inv\ prog\ g \implies (g,g) \in (gState\text{-}progress\text{-}rel\ prog)$   
 $\langle proof \rangle$

**lemma** *refl-on-gState-progress-rel*:  
 $refl\text{-}on\ (Collect\ (gState\text{-}inv\ prog))\ (gState\text{-}progress\text{-}rel\ prog)$   
 $\langle proof \rangle$

**lemma** *trans-gState-progress-rel[simp]*:  
 $trans\ (gState\text{-}progress\text{-}rel\ prog)$   
 $\langle proof \rangle$

**lemmas**  $gState\text{-}progress\text{-}rel\text{-}trans\ [trans] = trans\text{-}gState\text{-}progress\text{-}rel\ [THEN\ transD]$

**lemma** *gState-progress-rel-transcl-id[simp]*:  
 $(gState\text{-}progress\text{-}rel\ prog)^+ = gState\text{-}progress\text{-}rel\ prog$   
 $\langle proof \rangle$

**lemma** *gState-progress-rel-rtranscl-absorb*:  
**assumes**  $gState\text{-}inv\ prog\ g$   
**shows**  $(gState\text{-}progress\text{-}rel\ prog)^* \text{ “ } \{g\} = gState\text{-}progress\text{-}rel\ prog \text{ “ } \{g\}$   
 $\langle proof \rangle$

The main theorem: The set of all global states reachable from an initial state, is finite.

**lemma** *gStates-finite*:  
**fixes**  $g :: gState$   
**shows**  $finite\ ((gState\text{-}progress\text{-}rel\ prog)^* \text{ “ } \{g\})$   
 $\langle proof \rangle$

**lemma** *gState-progress-rel-channels-update*:  
**assumes**  $gState\text{-}inv\ prog\ g$   
**and**  $channel\text{-}inv\ c$   
**and**  $i < length\ (channels\ g)$   
**shows**  $(g, gState.channels\text{-}update\ (\lambda cs. cs[i:=c])\ g) \in gState\text{-}progress\text{-}rel\ prog$   
 $\langle proof \rangle$

**lemma** *gState-progress-rel-channels-update-step*:  
**assumes**  $gState\text{-}inv\ prog\ g$   
**and**  $step: (g, g') \in gState\text{-}progress\text{-}rel\ prog$   
**and**  $channel\text{-}inv\ c$   
**and**  $i < length\ (channels\ g')$   
**shows**  $(g, gState.channels\text{-}update\ (\lambda cs. cs[i:=c])\ g') \in gState\text{-}progress\text{-}rel\ prog$   
 $\langle proof \rangle$

## 4.5 Invariants of the program

Naturally, we need our program to also adhere to certain invariants. Else we can't show, that the generated states are correct according to the invariants above.

**definition** *program-inv* where

*program-inv prog*  
 $\longleftrightarrow$   $IArray.length\ (states\ prog) > 0$   
 $\wedge$   $IArray.length\ (states\ prog) = IArray.length\ (processes\ prog)$   
 $\wedge$   $(\forall s \in set\ (IArray.list-of\ (states\ prog)).\ IArray.length\ s > 0)$   
 $\wedge$   $lm.ball\ (proc-data\ prog)$   
 $(\lambda(-,sidx).$   
 $\quad sidx < IArray.length\ (processes\ prog)$   
 $\quad \wedge\ fst\ (processes\ prog\ !!\ sidx) = sidx)$   
 $\wedge$   $(\forall (sidx,start,procArgs,args) \in set\ (IArray.list-of\ (processes\ prog))).$   
 $\quad (\exists s.\ start = Index\ s \wedge s < IArray.length\ (states\ prog\ !!\ sidx)))$

**lemma** *program-inv-length-states*:

**assumes** *program-inv prog*  
**and**  $n < IArray.length\ (states\ prog)$   
**shows**  $IArray.length\ (states\ prog\ !!\ n) > 0$   
*<proof>*

**lemma** *program-invI*:

**assumes**  $0 < IArray.length\ (states\ prog)$   
**and**  $IArray.length\ (states\ prog) = IArray.length\ (processes\ prog)$   
**and**  $\bigwedge s.\ s \in set\ (IArray.list-of\ (states\ prog))$   
 $\implies 0 < IArray.length\ s$   
**and**  $\bigwedge sidx.\ sidx \in ran\ (lm.\alpha\ (proc-data\ prog))$   
 $\implies sidx < IArray.length\ (processes\ prog)$   
 $\quad \wedge\ fst\ (processes\ prog\ !!\ sidx) = sidx$   
**and**  $\bigwedge sidx\ start\ procArgs\ args.$   
 $\quad (sidx,start,procArgs,args) \in set\ (IArray.list-of\ (processes\ prog))$   
 $\implies \exists s.\ start = Index\ s \wedge s < IArray.length\ (states\ prog\ !!\ sidx)$   
**shows** *program-inv prog*  
*<proof>*

**end**

## 5 Formalization of Promela semantics

**theory** *Promela*

**imports**

*PromelaDatastructures*

*PromelaInvariants*

*PromelaStatistics*

**begin**

Auxiliary

**lemma** *mod-integer-le*:

$a \leq b \implies 0 < a \implies x\ mod\ (a + 1) \leq b$  **for**  $a\ b\ x :: integer$   
*<proof>*

**lemma** *mod-integer-ge*:

$b \leq 0 \implies 0 < a \implies b \leq x \text{ mod } (a+1)$  **for**  $a \ b \ x :: \text{integer}$   
 ⟨proof⟩

After having defined the datastructures, we present in this theory how to construct the transition system and how to generate the successors of a state, i. e. the real semantics of a Promela program. For the first task, we take the enriched AST as input, the second one operates on the transition system.

## 5.1 Misc Helpers

**definition** *add-label* :: *String.literal*  $\Rightarrow$  *labels*  $\Rightarrow$  *nat*  $\Rightarrow$  *labels* **where**

## 5.2 Variable handling

Handling variables, with their different scopes (global vs. local), and their different types (array vs channel vs bounded) is one of the main challenges of the implementation.

```

fun lookupVar :: variable  $\Rightarrow$  integer option  $\Rightarrow$  integer where
  lookupVar (Var - val) None = val
| lookupVar (Var - -) (Some -) = abort STR "Array used on var" ( $\lambda$ -.0)
| lookupVar (VArray - - vals) None = vals !! 0
| lookupVar (VArray - siz vals) (Some idx) = vals !! nat-of-integer idx

primrec checkVarValue :: varType  $\Rightarrow$  integer  $\Rightarrow$  integer where
  checkVarValue (VTBounded lRange hRange) val = (
    if val  $\leq$  hRange  $\wedge$  val  $\geq$  lRange then val
    else — overflowing is well-defined and may actually be used (e.g. bool)
      if lRange = 0  $\wedge$  val > 0
      then val mod (hRange + 1)
      else — we do not want to implement C-semantics (ie type casts)
        abort STR "Value overflow" ( $\lambda$ -. lRange)
  )
| checkVarValue VTChan val = (
  if val < min-var-value  $\vee$  val > max-var-value
  then abort STR "Value overflow" ( $\lambda$ -. 0)
  else val)

lemma [simp]:
  variable-inv (Var VTChan 0)
<proof>

## 5.7 AST to edges

**type-synonym**  $\text{ast} = \text{AST.module list}$

In this section, the AST is translated into the transition system.

Handling atomic blocks is non-trivial. Therefore, we do this in an extra pass:  $lp$  and  $hp$  are the positions of the start and the end of the atomic block. Every edge pointing into this range is therefore marked as *Atomic*. If they are pointing somewhere else, they are set to *InAtomic*, meaning: they start *in* an atomic block, but leave it afterwards.

**definition**  $\text{atomize} :: \text{nat} \Rightarrow \text{nat} \Rightarrow \text{edge list} \Rightarrow \text{edge list}$  **where**

$\text{atomize } lp \ hp \ es = \text{fold } (\lambda e \ es.$

$\text{let } e' = \text{case target } e \text{ of}$

$\text{LabelJump - None} \Rightarrow$

- Labels are checked again later on, when they
- are going to be resolved. Hence it is safe to say
- *atomic* here, especially as the later algorithm
- relies on targets in atomic blocks to be marked as such.

$e \langle \text{atomic} := \text{InAtomic} \rangle$

|  $\text{LabelJump - (Some via)} \Rightarrow$

$\text{if } lp \leq \text{via} \wedge hp \geq \text{via} \text{ then } e \langle \text{atomic} := \text{Atomic} \rangle$   
 $\text{else } e \langle \text{atomic} := \text{InAtomic} \rangle$

|  $\text{Index } p' \Rightarrow$

$\text{if } lp \leq p' \wedge hp \geq p' \text{ then } e \langle \text{atomic} := \text{Atomic} \rangle$   
 $\text{else } e \langle \text{atomic} := \text{InAtomic} \rangle$

in  $e' \# es$ )  $es$  []

```
fun skip — No-(edge)
where
  skip (lbls, pri, pos, nxt, -) =
  ([[([cond = ECEXPR (ExprConst 1),
    effect = EEID, target = nxt, prio = pri,
    atomic = NonAtomic)])], Index pos, lbls)
```

The AST is walked backwards. This allows to know the next state directly.  
Parameters used:

**lbls** Map of Labels

**pri** Current priority

**pos** Current position in the array

**nxt** Next state

**onxt** Previous 'next state' (where to jump after a 'do')

**inBlock** Needed for certain constructs to calculate the layout of the array

```
fun stepToState

#### 5.8.4 Handle non-termination

A Promela model may include non-terminating parts. Therefore we cannot guarantee, that *nexts* will actually terminate. To avoid having to deal with this in the model checker, we fail in case of non-termination.

**definition** *SUCCEED-abort* where

$$\begin{aligned} \text{SUCCEED-abort } msg \ dm \ m = & ( \\ & \text{case } m \text{ of} \\ & \text{RES } X \Rightarrow \text{if } X = \{\} \text{ then } \text{Code.abort } msg \ (\lambda\cdot. \ dm) \ \text{else } \text{RES } X \\ & | \_ \Rightarrow m) \end{aligned}$$

**definition** *dSUCCEED-abort* where

$$\begin{aligned} \text{dSUCCEED-abort } msg \ dm \ m = & ( \\ & \text{case } m \text{ of} \\ & \text{dSUCCEED}i \Rightarrow \text{Code.abort } msg \ (\lambda\cdot. \ dm) \\ & | \_ \Rightarrow m) \end{aligned}$$

**definition** *ref-succeed* where

$$\text{ref-succeed } m \ m' \longleftrightarrow m \leq m' \wedge (m = \text{SUCCEED} \longrightarrow m' = \text{SUCCEED})$$

**lemma** *dSUCCEED-abort-SUCCEED-abort*:

$$\begin{aligned} & \llbracket \text{RETURN } dm' \leq dm; \text{ref-succeed } (\text{nres-of } m') \ m \rrbracket \\ & \implies \text{nres-of } (\text{dSUCCEED-abort } msg \ (\text{dRETURN } dm')) \ (m') \\ & \leq \text{SUCCEED-abort } msg \ dm \ m \end{aligned}$$

*<proof>*

The final successor function now incorporates:

1. *nexts*
2. handling of non-termination

**definition** *nexts-code* where

$$\begin{aligned} \text{nexts-code } prog \ g = & \\ & \text{the-res } (\text{dSUCCEED-abort } (\text{STR } \text{"The Universe is broken!"}) \\ & \quad (\text{dRETURN } (\text{ls.sng } g)) \\ & \quad (\text{nexts-code-aux } prog \ g)) \end{aligned}$$

**lemma** *nexts-code-SPEC*:

$$\begin{aligned} & \text{assumes } g\text{State-inv } prog \ g \\ & \text{and } program\text{-inv } prog \\ & \text{shows } g' \in \text{ls.}\alpha \ (\text{nexts-code } prog \ g) \\ & \implies (g, g') \in g\text{State-progress-rel } prog \end{aligned}$$

*<proof>*

## 5.9 Finiteness of the state space

**inductive-set** *reachable-states*

**for**  $P :: \text{program}$

**and**  $g_s :: gState$  — start state

**where**

$g_s \in \text{reachable-states } P \ g_s \mid$

$g \in \text{reachable-states } P \ g_s \implies x \in \text{ls.}\alpha \ (\text{nexts-code } P \ g)$

$\implies x \in \text{reachable-states } P \ g_s$

**lemmas** *reachable-states-induct*[*case-names init step*] =

## 6 LTL integration

**theory** *PromelaLTL*

**imports**

*Promela*

*LTL.LTL*

**begin**

We have a semantic engine for Promela. But we need to have an integration with LTL – more specifically, we must know when a proposition is true in a global state. This is achieved in this theory.

### 6.1 LTL optimization

For efficiency reasons, we do not store the whole *expr* on the labels of a system automaton, but *nat* instead. This index then is used to look up the corresponding *expr*.

**type-synonym** *APs* = *expr iarray*

**primrec** *ltlc-aps-list' :: 'a ltlc  $\Rightarrow$  'a list  $\Rightarrow$  'a list*

**where**

*ltlc-aps-list' True-ltlc l* = *l*

| *ltlc-aps-list' False-ltlc l* = *l*

| *ltlc-aps-list' (Prop-ltlc p) l* = (*if List.member l p then l else p#l*)

| *ltlc-aps-list' (Not-ltlc x) l* = *ltlc-aps-list' x l*

| *ltlc-aps-list' (Next-ltlc x) l* = *ltlc-aps-list' x l*

$| \text{ltlc-aps-list}' (\text{Final-ltlc } x) l = \text{ltlc-aps-list}' x l$   
 $| \text{ltlc-aps-list}' (\text{Global-ltlc } x) l = \text{ltlc-aps-list}' x l$   
 $| \text{ltlc-aps-list}' (\text{And-ltlc } x y) l = \text{ltlc-aps-list}' y (\text{ltlc-aps-list}' x l)$   
 $| \text{ltlc-aps-list}' (\text{Or-ltlc } x y) l = \text{ltlc-aps-list}' y (\text{ltlc-aps-list}' x l)$

### 6.3 Proposition types and conversion

LTL formulae and propositions are also generated by an SML parser. Hence we have the same setup as for Promela itself: Mirror the data structures and (sometimes) map them to new ones.

This theory is intended purely to be used by frontend code to convert from *propc* to *expr*. The other theories work on *expr* directly.

While we could of course convert directly, that would introduce yet a semantic level.

**datatype** *binOp* = *Eq* | *Le* | *LEq* | *Gr* | *GEq*

**datatype** *ident* = *Ident String.literal integer option*

**datatype** *propc* = *CProp ident*
