

Relational Minimum Spanning Tree Algorithms

Walter Guttmann and Nicolas Robinson-O'Brien

May 26, 2024

Abstract

We verify the correctness of Prim's, Kruskal's and Borůvka's minimum spanning tree algorithms based on algebras for aggregation and minimisation.

1 Overview

The theories described in this document prove the correctness of Prim's, Kruskal's and Borůvka's minimum spanning tree algorithms. Specifications and algorithms work in Stone-Kleene relation algebras extended by operations for aggregation and minimisation. The algorithms are implemented in a simple imperative language and their proof uses Hoare logic. The correctness proofs are discussed in [3, 5, 6, 8].

1.1 Prim’s and Kruskal’s minimum spanning tree algorithms

A framework based on Stone relation algebras and Kleene algebras and extended by operations for aggregation and minimisation was presented by the first author in [3, 5] and used to formally verify the correctness of Prim’s minimum spanning tree algorithm. It was extended in [6] and applied to prove the correctness of Kruskal’s minimum spanning tree algorithm.

Two theories, one each for Prim’s and Kruskal’s algorithms, prove total correctness of these algorithms. As case studies for the algebraic framework, these two theories combined were originally part of another AFP entry [4].

1.2 Borůvka’s minimum spanning tree algorithm

Otakar Borůvka formalised the minimum spanning tree problem and proposed a solution to it [1]. Borůvka’s original paper is written in Czech; translations of varying completeness can be found in [2, 7].

The theory for Borůvka’s minimum spanning tree algorithm proves partial correctness of this algorithm. This work is based on the same algebraic framework as the proof of Kruskal’s algorithm; in particular it uses many theories from the hierarchy underlying [4].

The theory for Borůvka’s algorithm formally verifies results from the second author’s Master’s thesis [8].

2 Kruskal’s Minimum Spanning Tree Algorithm

In this theory we prove total correctness of Kruskal’s minimum spanning tree algorithm. The proof uses the following steps [6]. We first establish that the algorithm terminates and constructs a spanning tree. This is a constructive proof of the existence of a spanning tree; any spanning tree algorithm could be used for this. We then conclude that a minimum spanning tree exists. This is necessary to establish the invariant for the actual correctness proof, which shows that Kruskal’s algorithm produces a minimum spanning tree.

The following result shows that Kruskal's algorithm terminates and constructs a spanning tree. We cannot yet show that this is a minimum spanning

tree.

theorem *kruskal-spanning*:

```

VAR e f h
[ symmetric g ]
f := bot;
h := g;
WHILE h ≠ bot
  INV { kruskal-spanning-invariant f g h }
  VAR { card { x . regular x ∧ x ≤ --h } }
  DO e := minarc h;
    IF e ≤ --forest-components f THEN
      f := (f □ --(top * e * fT*)) □ (f □ top * e * fT*)T □ e
    ELSE
      SKIP
    FI;
    h := h □ --e □ --eT
  OD
[ spanning-forest f g ]
apply vcg-tc-simp
using kruskal-vc-1 apply simp
using kruskal-vc-2 apply simp
using kruskal-spanning-invariant-def by auto

```

Because we have shown total correctness, we conclude that a spanning tree exists.

lemma *kruskal-exists-spanning*:

```

symmetric g ⇒ ∃ f . spanning-forest f g
using tc-extract-function kruskal-spanning by blast

```

This implies that a minimum spanning tree exists, which is used in the subsequent correctness proof.

lemma *kruskal-exists-minimal-spanning*:

```

assumes symmetric g
shows ∃ f . minimum-spanning-forest f g
proof –
  let ?s = { f . spanning-forest f g }
  have ∃ m ∈ ?s . ∀ z ∈ ?s . sum (m □ g) ≤ sum (z □ g)
  apply (rule finite-set-minimal)
  using finite-regular spanning-forest-def apply simp
  using assms kruskal-exists-spanning apply simp
  using sum-linear by simp
  thus ?thesis
  using minimum-spanning-forest-def by simp
qed

```

Kruskal's minimum spanning tree algorithm terminates and is correct. This is the same algorithm that is used in the previous correctness proof, with the same precondition and variant, but with a different invariant and postcondition.

theorem *kruskal*:

```

  VARS e f h
  [ symmetric g ]
  f := bot;
  h := g;
  WHILE h ≠ bot
    INV { kruskal-invariant f g h }
    VAR { card { x . regular x ∧ x ≤ --h } }
    DO e := minarc h;
      IF e ≤ --forest-components f THEN
        f := (f □ --(top * e * fT*)) □ (f □ top * e * fT*)T □ e
      ELSE
        SKIP

3 Prim's Minimum Spanning Tree Algorithm

In this theory we prove total correctness of Prim's minimum spanning tree algorithm. The proof has the same overall structure as the total-correctness proof of Kruskal's algorithm [6]. The partial-correctness proof of Prim's algorithm is discussed in [3, 5].

theory *Prim*

imports *HOL-Hoare.Hoare-Logic Aggregation-Algebras.Aggregation-Algebras*

begin

context *m-kleene-algebra*

begin

abbreviation *component* $g\ r \equiv r^T * (---g)^*$

definition *spanning-tree* $t\ g\ r \equiv \text{forest } t \wedge t \leq (\text{component } g\ r)^T * (\text{component } g\ r) \sqcap ---g \wedge \text{component } g\ r \leq r^T * t^* \wedge \text{regular } t$

definition *minimum-spanning-tree* $t\ g\ r \equiv \text{spanning-tree } t\ g\ r \wedge (\forall u . \text{spanning-tree } u\ g\ r \longrightarrow \text{sum } (t \sqcap g) \leq \text{sum } (u \sqcap g))$

definition *prim-precondition* $g\ r \equiv g = g^T \wedge \text{injective } r \wedge \text{vector } r \wedge \text{regular } r$

definition *prim-spanning-invariant* $t\ v\ g\ r \equiv \text{prim-precondition } g\ r \wedge v^T = r^T * t^* \wedge \text{spanning-tree } t\ (v * v^T \sqcap g)\ r$

definition *prim-invariant* $t\ v\ g\ r \equiv \text{prim-spanning-invariant } t\ v\ g\ r \wedge (\exists w . \text{minimum-spanning-tree } w\ g\ r \wedge t \leq w)$

lemma *span-tree-split*:

assumes *vector* r

shows $t \leq (\text{component } g\ r)^T * (\text{component } g\ r) \sqcap ---g \longleftrightarrow (t \leq (\text{component } g\ r)^T \wedge t \leq \text{component } g\ r \wedge t \leq ---g)$

proof –

have $(\text{component } g\ r)^T * (\text{component } g\ r) = (\text{component } g\ r)^T \sqcap \text{component } g\ r$

by (*metis assms conv-involutive covector-mult-closed vector-conv-covector vector-covector*)

thus *?thesis*

by *simp*

qed

lemma *span-tree-component*:

assumes *spanning-tree* $t\ g\ r$

shows $\text{component } g\ r = \text{component } t\ r$

using *assms by (simp add: order.antisym mult-right-isotone star-isotone spanning-tree-def)*

We first show three verification conditions which are used in both correctness proofs.

The following result shows that Prim's algorithm terminates and constructs a spanning tree. We cannot yet show that this is a minimum spanning tree.

```

theorem prim-spanning:
  VARS t v e
  [ prim-precondition g r ]
  t := bot;
  v := r;
  WHILE v *  $-v^T$   $\sqcap$  g  $\neq$  bot
    INV { prim-spanning-invariant t v g r }
    VAR { card { x . regular x  $\wedge$  x  $\leq$  component g r  $\sqcap$   $-v^T$  } }
    DO e := minarc (v *  $-v^T$   $\sqcap$  g);
       t := t  $\sqcup$  e;
       v := v  $\sqcup$  eT * top
    OD
  [ spanning-tree t g r ]
apply vcg-tc-simp
apply (simp add: prim-vc-1)
using prim-vc-2 apply blast
using prim-vc-3 by auto

```

Because we have shown total correctness, we conclude that a spanning tree exists.

```

lemma prim-exists-spanning:
  prim-precondition g r  $\implies$   $\exists$  t . spanning-tree t g r
using tc-extract-function prim-spanning by blast

```

This implies that a minimum spanning tree exists, which is used in the subsequent correctness proof.

```

lemma prim-exists-minimal-spanning:
  assumes prim-precondition g r
  shows  $\exists$  t . minimum-spanning-tree t g r

```

Prim's minimum spanning tree algorithm terminates and is correct. This is the same algorithm that is used in the previous correctness proof, with

the same precondition and variant, but with a different invariant and post-condition.

theorem *prim*:

```

VAR t v e
[ prim-precondition g r  $\wedge$  ( $\exists w$  . minimum-spanning-tree w g r) ]
t := bot;
v := r;
WHILE v *  $-v^T$   $\sqcap$  g  $\neq$  bot
  INV { prim-invariant t v g r }
  VAR { card { x . regular x  $\wedge$  x  $\leq$  component g r  $\sqcap$   $-v^T$  } }
  DO e := minarc (v *  $-v^T$   $\sqcap$  g);
    t := t  $\sqcup$  e;
    v := v  $\sqcup$  eT * top
  OD
[ minimum-spanning-tree t g r ]

```

4.3 An operation to select components

This section has been moved to theories *Stone-Relation-Algebras.Choose-Component* and *Aggregation-Algebras.M-Choose-Component*.

4.4 m-k-Stone-Kleene relation algebras

m-k-Stone-Kleene relation algebras are an extension of *m-Kleene algebras* where the *choose-component* operation has been added.

context *m-kleene-algebra-choose-component*
begin

A *selected-edge* is a minimum-weight edge whose source is in a component, with respect to h , j and g , and whose target is not in that component.

abbreviation *selected-edge* $h j g \equiv minarc (choose-component (forest-components h) j * - choose-component (forest-components h) j^T \sqcap g)$

A *path* is any sequence of edges in the forest, f , of the graph, g , backwards from the target of the *selected-edge* to a root in f .

abbreviation *path* $f h j g \equiv top * selected-edge h j g * (f \sqcap - selected-edge h j g^T)^{T*}$

definition *boruvka-outer-invariant* $f g \equiv$
 $symmetric g$
 $\wedge forest f$
 $\wedge f \leq --g$
 $\wedge regular f$
 $\wedge (\exists w . minimum-spanning-forest w g \wedge f \leq w \sqcup w^T)$

definition *boruvka-inner-invariant* $j f h g d \equiv$
 $boruvka-outer-invariant f g$
 $\wedge g \neq bot$
 $\wedge regular d$
 $\wedge regular j \wedge vector j$
 $\wedge regular h \wedge forest h$
 $\wedge forest-components h * j = j$
 $\wedge forest-modulo-equivalence (forest-components h) d$
 $\wedge d * top \leq - j$

$\wedge f \sqcup f^T = h \sqcup h^T \sqcup d \sqcup d^T$

4.4.2 Identifying arcs

The expression $d \sqcap \top e^\top H \sqcap (Hd^\top)^* Ha^\top \top$ identifies the edge incoming to the component that the *selected-edge*, e , is outgoing from and which is on the path from edge a to e . Here, we prove this expression is an *arc*.

lemma *shows-arc-x*:

assumes *forest-modulo-equivalence H d*
and *forest-modulo-equivalence-path a e H d*
and $H * d * (H * d)^* \leq - H$
and $\neg a^\top * top \leq H * e * top$
and *regular a*
and *regular e*
and *regular H*
and *regular d*

shows $arc (d \sqcap top * e^T * H \sqcap (H * d^T)^* * H * a^T * top)$
proof –

To maintain that f can be extended to a minimum spanning forest we identify an edge, $i = v \sqcap \overline{F}e \sqcap \sqcap \sqcup e^\top F$, that may be exchanged with the

selected-edge, e. Here, we show that *i* is an *arc*.

lemma *boruwka-edge-arc*:

assumes *equivalence F*

and *forest v*

and *arc e*

and *regular F*

and $F \leq \text{forest-components } (F \sqcap v)$

and *regular v*

and $v * e^T = \text{bot}$

and $e * F * e = \text{bot}$

and $e^T \leq v^*$

and $e \neq \text{bot}$

shows *arc* $(v \sqcap -F * e * \text{top} \sqcap \text{top} * e^T * F)$

proof –

let $?i = v \sqcap -F * e * \text{top} \sqcap \text{top} * e^T * F$

have 1: $?i^T * \text{top} * ?i \leq 1$

proof –

4.4.3 Comparison of edge weights

In this section we compare the weight of the *selected-edge* with other edges of interest. For example, Theorem *e-leq-c-c-complement-transpose-general* is used to show that the *selected-edge* has its source inside and its target outside the component it is chosen for.

lemma *e-leq-c-c-complement-transpose-general*:

assumes $e = \text{minarc } (v * -(v)^T \sqcap g)$

and *regular* v

shows $e \leq v * -(v)^T$

proof –

have $e \leq -- (v * - v^T \sqcap g)$

using *assms(1) minarc-below order-trans* **by** *blast*

also have $\dots \leq -- (v * - v^T)$

using *order-lesseq-imp pp-isotone-inf* **by** *blast*

also have $\dots = v * - v^T$

using *assms(2) regular-mult-closed* **by** *auto*

finally show *?thesis*

If there is a path in the *forest-modulo-equivalence* from an edge between components, a , to the *selected-edge*, e , then the weight of e is no greater than the weight of a . This is because either,

- * the edges a and e are adjacent the same component so that we can use *sum-e-below-sum-x-when-outgoing-same-component*, or
- * there is at least one edge between a and e , namely x , the edge incoming to the component that e is outgoing from. The path from a to e is split

on x using *forest-modulo-equivalence-path-split-disj*. We show that the weight of e is no greater than the weight of x by making use of lemma *sum-e-below-sum-x-when-outgoing-same-component*. We define x in a way that we can show that the weight of x is no greater than the weight of a using the invariant. Then, it follows that the weight of e is no greater than the weight of a owing to transitivity.

lemma *a-to-e-in-forest-modulo-equivalence*:

assumes *symmetric g*
and $f \leq --g$
and *vector j*
and *forest h*
and *forest-modulo-equivalence (forest-components h) d*
and $f \sqcup f^T = h \sqcup h^T \sqcup d \sqcup d^T$

4.5 Formalization and correctness proof

The following result shows that Borůvka's algorithm constructs a minimum spanning forest. We have the same postcondition as the proof of Kruskal's minimum spanning tree algorithm. We show only partial correctness.

theorem *boruvka-mst*:

```

  VARS f j h c e d
  { symmetric g }
  f := bot;
  WHILE ¬(forest-components f) ⊔ g ≠ bot
  INV { boruvka-outer-invariant f g }
  DO
    j := top;
    h := f;
    d := bot;
    WHILE j ≠ bot
    INV { boruvka-inner-invariant j f h g d }
    DO
      c := choose-component (forest-components h) j;
      e := minarc(c * -cT ⊔ g);
      IF e ≤ -(forest-components f) THEN
        f := f ⊔ -eT;
        f := (f ⊔ -(top * e * fT)) ⊔ (f ⊔ top * e * fT)T ⊔ e;
        d := d ⊔ e
      ELSE
        SKIP
    FI;
    j := j ⊔ -c

```

```
