

Shadow DOM

A Formal Model of the Document Object Model *with Shadow Roots*

Abstract

In this AFP entry, we extend our formalization of the core DOM (AFP entry `Core_DOM`) with *Shadow Roots*. Shadow roots are a recent proposal of the web community to support a component-based development approach for client-side web applications.

Shadow roots are a significant extension to the DOM standard and, as web standards are condemned to be backward compatible, such extensions often result in complex specification that may contain unwanted subtleties that can be detected by a formalization.

Our Isabelle/HOL formalization is, in the sense of object-orientation, an extension of our formalization of the core DOM and enjoys the same basic properties, i.e., it is 1. *extensible*, i.e., can be extended without the need of re-proving already proven properties and 2. *executable*, i.e., we can generate executable code from our specification. We exploit the executability to show that our formalization complies to the official standard of the W3C, respectively, the WHATWG.

Keywords: Document Object Model, DOM, Shadow Root, Web Component, Formal Semantics, Isabelle/HOL

1 Introduction

In a world in which more and more applications are offered as services on the internet, web browsers start to take on a similarly central role in our daily IT infrastructure as operating systems. Thus, web browsers should be developed as rigidly and formally as operating systems. While formal methods are a well-established technique in the development of operating systems (see, e. g., Klein [13] for an overview of formal verification of operating systems), there are few proposals for improving the development of web browsers using formal approaches [1, 10, 12, 14].

In [3], we formalized the core of the Document Object Model (DOM) in Isabelle/HOL. The DOM [15, 16] is *the* central data structure of all modern web browsers. In this work, we extend the formalization presented in [3] with support for *shadow trees*. Shadow trees are a recent addition to the DOM standard [16] that promise support for web components. As we will see, this promise is not fully achieved and, for example, the DOM standard itself does not formally define what a component should be. In this work, we focus on a standard compliant representation of the DOM with shadow trees. As [3], our formalization has the following properties:

- It provides a *consistency guarantee*. Since all definitions in our formal semantics are conservative and all rules are derived, the logical consistency of the DOM node-tree is reduced to the consistency of HOL.
- It serves as a *technical basis for a proof system*. Based on the derived rules and specific setup of proof tactics over node-trees, our formalization provides a generic proof environment for the verification of programs manipulating node-trees.
- It is *executable*, which allows to validate its compliance to the standard by evaluating the compliance test suite on the formal model and
- It is *extensible* in the sense of [2, 8], i. e., properties proven over the core DOM do not need to be re-proven for object-oriented extensions such as the HTML document model.

In this AFP entry, we limit ourselves to the faithful formalization of the DOM. As the DOM standard does not formally define web components, we address the question of formally defining web components and discussing their safety properties elsewhere [5, 6].

The rest of this document is automatically generated from the formalization in Isabelle/HOL, i. e., all content is checked by Isabelle (we refer readers interested in a more high-level presentation and additional explanations to [6, 11]). The structure follows the theory dependencies (see Figure 1.1): first, we formalize the DOM with Shadow Roots (chapter 2) and then formalize we the relevant compliance test cases in chapter 3.

Figure 1.1: The Dependency Graph of the Isabelle Theories.

2 The Shadow DOM

In this chapter, we introduce the formalization of the core DOM *with Shadow Roots*, i.e., the most important algorithms for querying or modifying the Shadow DOM, as defined in the standard.

2.1 The Shadow DOM Data Model (ShadowRootClass)

```
theory ShadowRootClass
```

```
  imports
```

```
    Core_DOM.ShadowRootPointer

3 Test Suite

In this chapter, we present the formalized compliance test cases for the core DOM. As our formalization is executable, we can (symbolically) execute the test cases on top of our model. Executing these test cases successfully shows that our model is compliant to the official DOM standard. As future work, we plan to generate test cases from our formal model (e.g., using [7, 9]) to improve the quality of the official compliance test suite. For more details on the relation of test and proof in the context of web standards, we refer the reader to [4].

3.7 Testing Node_removeChild (Shadow_DOM_Node_removeChild)

This theory contains the test cases for Node_removeChild.

```
theory Shadow_DOM_Node_removeChild
```

```
imports
```

```
"Shadow_DOM_BaseTest"
```

```
begin
```

```
definition Node_removeChild_heap :: heapfinal where
```

```

"Node_removeChild_heap = create_heap [(cast (document_ptr.Ref 1), cast (create_document_obj html (Some
(cast (element_ptr.Ref 1))) [])),
(cast (element_ptr.Ref 1), cast (create_element_obj 'html' [cast (element_ptr.Ref 2), cast (element_ptr.Ref
7)] fmempty None)),
(cast (element_ptr.Ref 2), cast (create_element_obj 'head' [cast (element_ptr.Ref 3), cast (element_ptr.Ref
4), cast (element_ptr.Ref 5), cast (element_ptr.Ref 6)] fmempty None)),
(cast (element_ptr.Ref 3), cast (create_element_obj 'title' [cast (character_data_ptr.Ref 1)] fmempty
None)),
(cast (character_data_ptr.Ref 1), cast (create_character_data_obj 'Node.removeChild')),
(cast (element_ptr.Ref 4), cast (create_element_obj 'script' [] (fmap_of_list [( 'src', '/resources/testhar
None)),
(cast (element_ptr.Ref 5), cast (create_element_obj 'script' [] (fmap_of_list [( 'src', '/resources/testhar
None)),
(cast (element_ptr.Ref 6), cast (create_element_obj 'script' [] (fmap_of_list [( 'src', 'creators.js']))
None)),
(cast (element_ptr.Ref 7), cast (create_element_obj 'body' [cast (element_ptr.Ref 8), cast (element_ptr.Ref
9), cast (element_ptr.Ref 10)] fmempty None)),
