The Stern-Brocot Tree

Peter Gammie   Andreas Lochbihler

August 16, 2018

Abstract

The Stern-Brocot tree contains all rational numbers exactly once and in their lowest terms. We formalise the Stern-Brocot tree as a coinductive tree using recursive and iterative specifications, which we have proven equivalent, and show that it indeed contains all the numbers as stated. Following Hinze, we prove that the Stern-Brocot tree can be linearised looplessly into Stern's diatonic sequence (also known as Dijkstra's fusc function) and that it is a permutation of the Bird tree.

The reasoning stays at an abstract level by appealing to the uniqueness of solutions of guarded recursive equations and lifting algebraic laws point-wise to trees and streams using applicative functors.

Contents

Acknowledgements Thanks to Dave Cock for a fruitful discussion about unique fixed points.

begin

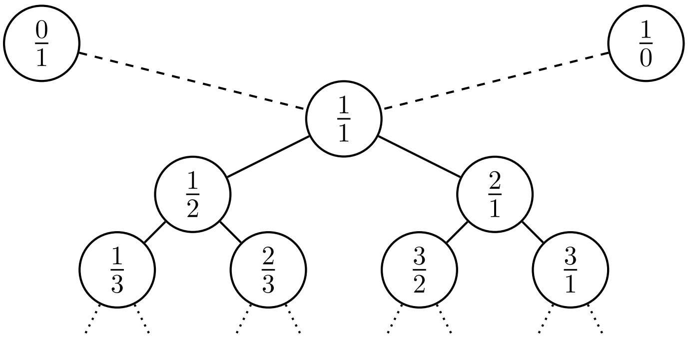

Figure 1: Constructing the Stern-Brocot tree iteratively.

The Stern-Brocot tree is discussed at length by Graham et al. (1994, §4.5). In essence the tree enumerates the rational numbers in their lowest terms by constructing the *mediant* of two bounding fractions.

type-synonym *fraction* = *nat* × *nat*

definition *mediant* :: *fraction* × *fraction* ⇒ *fraction*
where *mediant* ≡ λ((*a*, *c*), (*b*, *d*)). (*a* + *b*, *c* + *d*)

definition *stern-brocot* :: *fraction tree*
where
  stern-brocot = *unfold-tree*
    (λ(*lb*, *ub*). *mediant* (*lb*, *ub*))
    (λ(*lb*, *ub*). (*lb*, *mediant* (*lb*, *ub*)))
    (λ(*lb*, *ub*). (*mediant* (*lb*, *ub*), *ub*))
    ((*0*, *1*), (*1*, *0*))

This process is visualised in Figure 2. Intuitively each node is labelled with the mediant of it's rightmost and leftmost ancestors.

Our ultimate goal is to show that the Stern-Brocot tree contains all rationals (in lowest terms), and that each occurs exactly once in the tree. A proof is sketched in Graham et al. (1994, §4.5).

2.1 Specification via a recursion equation

Hinze (2009) derives the following recurrence relation for the Stern-Brocot tree. We will show in §2.5 that his derivation is sound with respect to the standard iterative definition of the tree shown above.

abbreviation *succ* :: *fraction* ⇒ *fraction*
where *succ* ≡ λ(*m*, *n*). (*m* + *n*, *n*)

abbreviation *recip* :: *fraction* ⇒ *fraction*
where *recip* ≡ λ(*m*, *n*). (*n*, *m*)

corec *stern-brocot-recurse* :: *fraction tree*
where
  stern-brocot-recurse =
   Node (*1*, *1*)
     (*map-tree recip* (*map-tree succ* (*map-tree recip stern-brocot-recurse*)))
     (*map-tree succ stern-brocot-recurse*)

Actually, we would like to write the specification below, but (⋄) cannot be registered as friendly due to varying type parameters

lemma *stern-brocot-unfold*:
  stern-brocot-recurse =
   Node (*1*, *1*)
       (*pure recip* ⋄ (*pure succ* ⋄ (*pure recip* ⋄ *stern-brocot-recurse*)))
       (*pure succ* ⋄ *stern-brocot-recurse*)
⟨*proof*⟩

lemma *stern-brocot-simps* [*simp*]:
  root stern-brocot-recurse = (*1*, *1*)
  left stern-brocot-recurse = *pure recip* ⋄ (*pure succ* ⋄ (*pure recip* ⋄ *stern-brocot-recurse*))
  right stern-brocot-recurse = *pure succ* ⋄ *stern-brocot-recurse*
⟨*proof*⟩

lemma *stern-brocot-conv*:
  stern-brocot-recurse = *tree-recurse* (*recip* ∘ *succ* ∘ *recip*) *succ* (*1*, *1*)
⟨*proof*⟩

2.2 Basic properties

The recursive definition is useful for showing some basic properties of the tree, such as that the pairs of numbers at each node are coprime, and have non-zero denominators. Both are simple inductions on the path.

lemma *stern-brocot-denominator-non-zero*:
  case root (*traverse-tree path stern-brocot-recurse*) *of* (*m*, *n*) ⇒ *m* > *0* ∧ *n* > *0*
⟨*proof*⟩

lemma *stern-brocot-coprime*:
  case root (*traverse-tree path stern-brocot-recurse*) *of* (*m*, *n*) ⇒ *coprime m n*
  ⟨*proof*⟩

2.3 All the rationals

For every pair of positive naturals, we can construct a path into the Stern-Brocot tree such that the naturals at the end of the path define the same rational as the pair we started with. Intuitively, the choices made by Euclid's algorithm define this path.

function *mk-path* :: *nat* ⇒ *nat* ⇒ *path* **where**

$m = n \Longrightarrow$ *mk-path* (*Suc* m) (*Suc* n) = []
| $m < n \Longrightarrow$ *mk-path* (*Suc* m) (*Suc* n) = L # *mk-path* (*Suc* m) ($n - m$)
| $m > n \Longrightarrow$ *mk-path* (*Suc* m) (*Suc* n) = R # *mk-path* ($m - n$) (*Suc* n)
| *mk-path* *0* - = *undefined*
| *mk-path* - *0* = *undefined*
⟨*proof*⟩
termination *mk-path* ⟨*proof*⟩

lemmas *mk-path-induct*[*case-names equal less greater*] = *mk-path.induct*

abbreviation *rat-of* :: *fraction* ⇒ *rat*
where *rat-of* ≡ $\lambda(x, y)$. *Fract* (*int* x) (*int* y)

theorem *stern-brocot-rationals*:
⟦ $m > 0$; $n > 0$ ⟧ $\Longrightarrow$
root (*traverse-tree* (*mk-path* m n) (*pure rat-of* ⋄ *stern-brocot-recurse*)) = *Fract* (*int* m) (*int* n)
⟨*proof*⟩

2.4 No repetitions

We establish that the Stern-Brocot tree does not contain repetitions, i.e., that each rational number appears at most once in it. Note that this property is stronger than merely requiring that pairs of naturals not be repeated, though it is implied by that property and *stern-brocot-coprime*.

Intuitively, the tree enjoys the *binary search tree* ordering property when we map our pairs of naturals into rationals. This suffices to show that each rational appears at most once in the tree. To establish this seems to require more structure than is present in the recursion equations, and so we follow Backhouse and Ferreira (2008) and Hinze (2009) by introducing another definition of the tree, which summarises the path to each node using a matrix.

We then derive an iterative version and use invariant reasoning on that. We begin by defining some matrix machinery. This is all elementary and primitive (we do not need much algebra).

type-synonym *matrix* = *fraction* × *fraction*
type-synonym *vector* = *fraction*

definition *times-matrix* :: *matrix* ⇒ *matrix* ⇒ *matrix* (**infixl** ⊗ *70*)
where *times-matrix* = $(\lambda((a, c), (b, d))\ ((a', c'), (b', d')).$

⟨*proof*⟩

end

no-notation *times-matrix* (**infixl** $\otimes$ *70*)
  and *times-vector* (**infixl** $\odot$ *70*)

3 Linearising the Stern-Brocot Tree

3.1 Turning a tree into a stream

corec *tree-chop* :: *'a tree* $\Rightarrow$ *'a tree*
where *tree-chop t* = *Node* (*root* (*left t*)) (*right t*) (*tree-chop* (*left t*))

lemma *tree-chop-sel* [*simp*]:
  root (*tree-chop t*) = *root* (*left t*)
  left (*tree-chop t*) = *right t*
  right (*tree-chop t*) = *tree-chop* (*left t*)
⟨*proof*⟩

tree-chop is a idiom homomorphism

lemma *tree-chop-pure-tree* [*simp*]:
  tree-chop (*pure x*) = *pure x*
⟨*proof*⟩

lemma *tree-chop-ap-tree* [*simp*]:
  tree-chop (*f* $\diamond$ *x*) = *tree-chop f* $\diamond$ *tree-chop x*
⟨*proof*⟩

lemma *tree-chop-plus*: *tree-chop* (*t* + *t'*) = *tree-chop t* + *tree-chop t'*
⟨*proof*⟩

corec *stream* :: *'a tree* $\Rightarrow$ *'a stream*
where *stream t* = *root t* ## *stream* (*tree-chop t*)

lemma *stream-sel* [*simp*]:
  shd (*stream t*) = *root t*
  stl (*stream t*) = *stream* (*tree-chop t*)
⟨*proof*⟩

stream is an idiom homomorphism.

lemma *stream-pure* [*simp*]: *stream* (*pure x*) = *pure x*
⟨*proof*⟩

lemma *stream-ap* [*simp*]: *stream* (*f* $\diamond$ *x*) = *stream f* $\diamond$ *stream x*
⟨*proof*⟩

lemma *stream-plus* [*simp*]: *stream* (*t* + *t'*) = *stream t* + *stream t'*
⟨*proof*⟩

lemma *stream-minus* [*simp*]: *stream* $(t - t') =$ *stream* $t -$ *stream* t'
⟨*proof*⟩

lemma *stream-times* [*simp*]: *stream* $(t * t') =$ *stream* $t *$ *stream* t'
⟨*proof*⟩

lemma *stream-mod* [*simp*]: *stream* $(t$ *mod* $t') =$ *stream* t *mod stream* t'
⟨*proof*⟩

lemma *stream-1* [*simp*]: *stream 1* = *1*
⟨*proof*⟩

lemma *stream-numeral* [*simp*]: *stream* (*numeral n*) = *numeral n*
⟨*proof*⟩

3.2 Split the Stern-Brocot tree into numerators and denumerators

corec *num-den* :: *bool* ⇒ *nat tree*
where
  num-den x =
   Node 1
    (*if x then num-den True else num-den True* + *num-den False*)
    (*if x then num-den True* + *num-den False else num-den False*)

abbreviation *num* **where** *num* ≡ *num-den True*
abbreviation *den* **where** *den* ≡ *num-den False*

lemma *num-unfold*: *num* = *Node 1 num* (*num* + *den*)
⟨*proof*⟩

lemma *den-unfold*: *den* = *Node 1* (*num* + *den*) *den*
⟨*proof*⟩

lemma *num-simps* [*simp*]:
  root num = *1*
  left num = *num*
  right num = *num* + *den*
⟨*proof*⟩

lemma *den-simps* [*simp*]:
  root den = *1*
  left den = *num* + *den*
  right den = *den*
⟨*proof*⟩

lemma *stern-brocot-num-den*:
  pure-tree Pair ◇ *num* ◇ *den* = *stern-brocot-recurse*
⟨*proof*⟩

lemma *den-eq-chop-num*: $den = tree\text{-}chop\ num$
⟨*proof*⟩

lemma *num-conv*: $num = pure\ fst \diamond stern\text{-}brocot\text{-}recurse$
⟨*proof*⟩

lemma *den-conv*: $den = pure\ snd \diamond stern\text{-}brocot\text{-}recurse$
⟨*proof*⟩

corec *num-mod-den* :: *nat tree*
where $num\text{-}mod\text{-}den = Node\ 0\ num\ num\text{-}mod\text{-}den$

lemma *num-mod-den-simps* [*simp*]:
  $root\ num\text{-}mod\text{-}den = 0$
  $left\ num\text{-}mod\text{-}den = num$
  $right\ num\text{-}mod\text{-}den = num\text{-}mod\text{-}den$
⟨*proof*⟩

The arithmetic transformations need the precondition that *den* contains only positive numbers, no *0*. Hinze (2009, p502) gets a bit sloppy here; it is not straightforward to adapt his lifting framework Hinze (2010) to conditional equations.

lemma *mod-tree-lemma1*:
  fixes x :: *nat tree*
  assumes $\forall\, i \in set\text{-}tree\ y.\ 0 < i$
  shows $x\ mod\ (x + y) = x$
⟨*proof*⟩

lemma *mod-tree-lemma2*:
  fixes $x\ y$ :: $'a$ :: *unique-euclidean-semiring tree*
  shows $(x + y)\ mod\ y = x\ mod\ y$
⟨*proof*⟩

lemma *set-tree-pathD*: $x \in set\text{-}tree\ t \Longrightarrow \exists\, p.\ x = root\ (traverse\text{-}tree\ p\ t)$
⟨*proof*⟩

lemma *den-gt-0*: $0 < x$ **if** $x \in set\text{-}tree\ den$
⟨*proof*⟩

lemma *num-mod-den*: $num\ mod\ den = num\text{-}mod\text{-}den$
⟨*proof*⟩

lemma *tree-chop-den*: $tree\text{-}chop\ den = num + den - 2 * (num\ mod\ den)$
⟨*proof*⟩

3.3 Loopless linearisation of the Stern-Brocot tree.

This is a loopless linearisation of the Stern-Brocot tree that gives Stern's diatomic sequence, which is also known as Dijkstra's fusc function Dijkstra (1982a,b). Loopless à la Bird (2006) means that the first element of the stream can be computed in linear time and every further element in constant time.

friend-of-corec *smap* :: $('a \Rightarrow 'a) \Rightarrow 'a\ stream \Rightarrow 'a\ stream$
where $smap\ f\ xs = SCons\ (f\ (shd\ xs))\ (smap\ f\ (stl\ xs))$
$\langle proof \rangle$

definition *step* :: $nat \times nat \Rightarrow nat \times nat$
where $step = (\lambda(n,\ d).\ (d,\ n + d - 2 * (n\ mod\ d)))$

corec *stern-brocot-loopless* :: *fraction stream*
where $stern\text{-}brocot\text{-}loopless = (1,\ 1)\ \#\#\ smap\ step\ stern\text{-}brocot\text{-}loopless$

lemmas $stern\text{-}brocot\text{-}loopless\text{-}rec = stern\text{-}brocot\text{-}loopless.code$

friend-of-corec *plus* **where** $s + s' = (shd\ s + shd\ s')\ \#\#\ (stl\ s + stl\ s')$
$\langle proof \rangle$

friend-of-corec *minus* **where** $t - t' = (shd\ t - shd\ t')\ \#\#\ (stl\ t - stl\ t')$

$\langle proof \rangle$

corec $fusc'$ :: *nat stream*
where $fusc' = 1\ \#\#\ (((1\ \#\#\ fusc') + fusc') - 2 * ((1\ \#\#\ fusc')\ mod\ fusc'))$

definition *fusc* **where** $fusc = 1\ \#\#\ fusc'$

lemma *fusc-unfold*: $fusc = 1\ \#\#\ fusc'$ $\langle proof \rangle$

lemma $fusc'$*-unfold*: $fusc' = 1\ \#\#\ (fusc + fusc' - 2 * (fusc\ mod\ fusc'))$
$\langle proof \rangle$

lemma *fusc-simps* [*simp*]:
  $shd\ fusc = 1$
  $stl\ fusc = fusc'$
$\langle proof \rangle$

lemma $fusc'$*-simps* [*simp*]:

$shd\ fusc' = 1$
$stl\ fusc' = fusc + fusc' - 2 * (fusc\ mod\ fusc')$
⟨*proof*⟩

3.4 Equivalence with Dijkstra's fusc function

lemma *stern-brocot-loopless-siterate*: *stern-brocot-loopless* = *siterate step* (*1*, *1*)
⟨*proof*⟩

lemma *fusc-fusc′-iterate*: *pure Pair* ◇ *fusc* ◇ *fusc′* = *stern-brocot-loopless*
⟨*proof*⟩

theorem *stern-brocot-loopless*:
stream stern-brocot-recurse = *stern-brocot-loopless* (**is** *?lhs* = *?rhs*)
⟨*proof*⟩

end

4 The Bird tree

We define the Bird tree following Hinze (2009) and prove that it is a permutation of the Stern-Brocot tree. As a corollary, we derive that the Bird tree also contains all rational numbers in lowest terms exactly once.

theory *Bird-Tree* **imports** *Stern-Brocot-Tree* **begin**

corec *bird* :: *fraction tree*
where
bird = *Node* (*1*, *1*) (*map-tree recip* (*map-tree succ bird*)) (*map-tree succ* (*map-tree recip bird*))
