Syntax-Independent Logic Infrastructure

Abstract

We formalize a notion of logic whose terms and formulas are kept abstract. In particular, logical connectives, substitution, free variables, and provability are not defined, but characterized by their general properties as locale assumptions. Based on this abstract characterization, we develop further reusable reasoning infrastructure. For example, we define parallel substitution (along with proving its characterizing theorems) from single-point substitution. Similarly, we develop a natural deduction style proof system starting from the abstract Hilbert-style one. These one-time efforts benefit different concrete logics satisfying our locales' assumptions.

We instantiate the syntax-independent logic infrastructure to Robinson arithmetic (also known as Q) in the AFP entry Robinson_Arithmetic and to hereditarily finite set theory in the AFP entries Goedel_HFSet_Semantic and Goedel_HFSet_Semanticless, which are part of our formalization of Gödel's Incompleteness Theorems described in our CADE-27 paper [1].

Syntax

2.1 Generic Syntax

We develop some generic (meta-)axioms for syntax and substitution. We only assume that the syntax of our logic has notions of variable, term and formula, which *include* subsets of "numeric" variables, terms and formulas, the latter being endowed with notions of free variables and substitution subject to some natural properties.

locale *Generic_Syntax* =
fixes
var :: *'var set* — numeric variables (i.e., variables ranging over numbers)
and *trm* :: *'trm set* — numeric trms, which include the numeric variables
and *fmla* :: *'fmla set* — numeric formulas
and *Var* :: *'var* ⇒ *'trm* — trms include at least the variables
and *FvarsT* :: *'trm* ⇒ *'var set* — free variables for trms
and *substT* :: *'trm* ⇒ *'trm* ⇒ *'var* ⇒ *'trm* — substitution for trms
and *Fvars* :: *'fmla* ⇒ *'var set* — free variables for formulas

2.6 Allowing the Renaming of Quantified Variables

So far, we did not need any renaming axiom for the quantifiers. However, our axioms for substitution implicitly assume the irrelevance of the bound names; in other words, their usual instances would have this property; and since this assumption greatly simplifies the formal development, we make it at this point.

3.2.5 Consistency and ω-consistency

definition *consistent* :: *bool* **where**
consistent $\equiv \neg$ *prv fls*

lemma *consistent_def2*: *consistent* $\longleftrightarrow$ ($\exists\, \varphi \in$ *fmla*. $\neg$ *prv* φ)
⟨*proof*⟩

lemma *consistent_def3*: *consistent* $\longleftrightarrow$ $(\forall\, \varphi \in fmla.\ \neg\ (prv\ \varphi \wedge prv\ (neg\ \varphi)))$
⟨*proof*⟩

definition ω*consistent* :: *bool* **where**
ω*consistent* $\equiv$
$\forall\ \varphi \in fmla.\ \forall\ x \in var.\ Fvars\ \varphi = \{x\} \longrightarrow$
$(\forall\ n \in num.\ prv\ (neg\ (subst\ \varphi\ n\ x)))$
$\longrightarrow$
$\neg\ prv\ (neg\ (neg\ (exi\ x\ \varphi)))$

The above particularly strong version of ω*consistent* is used for the sake of working without assuming classical logic. It of course implies the more standard formulations for classical logic:

definition ω*consistentStd1* :: *bool* **where**
ω*consistentStd1* $\equiv$
$\forall\ \varphi \in fmla.\ \forall\ x \in var.\ Fvars\ \varphi = \{x\} \longrightarrow$
$(\forall\ n \in num.\ prv\ (neg\ (subst\ \varphi\ n\ x))) \longrightarrow \neg\ prv\ (exi\ x\ \varphi)$

definition ω*consistentStd2* :: *bool* **where**
ω*consistentStd2* $\equiv$
$\forall\ \varphi \in fmla.\ \forall\ x \in var.\ Fvars\ \varphi = \{x\} \longrightarrow$
$(\forall\ n \in num.\ prv\ (subst\ \varphi\ n\ x)) \longrightarrow \neg\ prv\ (exi\ x\ (neg\ \varphi))$

lemma ω*consistent_impliesStd1*:
ω*consistent* $\Longrightarrow$
ω*consistentStd1*
⟨*proof*⟩

lemma ω*consistent_impliesStd2*:
ω*consistent* $\Longrightarrow$
ω*consistentStd2*
⟨*proof*⟩

In the presence of classical logic deduction, the stronger condition is equivalent to the standard ones:

lemma ω*consistent_iffStd1*:
assumes $\bigwedge \varphi.\ \varphi \in fmla \Longrightarrow prv\ (imp\ (neg\ (neg\ \varphi))\ \varphi)$
shows ω*consistent* $\longleftrightarrow$ ω*consistentStd1*
⟨*proof*⟩

lemma ω*consistent_iffStd2*:
assumes $\bigwedge \varphi.\ \varphi \in fmla \Longrightarrow prv\ (imp\ (neg\ (neg\ \varphi))\ \varphi)$
shows ω*consistent* $\longleftrightarrow$ ω*consistentStd2*
⟨*proof*⟩

ω-consistency implies consistency:

lemma ω*consistentStd1_implies_consistent*:
assumes ω*consistentStd1*
shows *consistent*
⟨*proof*⟩

lemma ω*consistentStd2_implies_consistent*:
assumes ω*consistentStd2*
shows *consistent*
⟨*proof*⟩

corollary ω*consistent_implies_consistent*:

shows *consistent*

3.5 Deduction with PseudoOrder Axioms Included

We assume a two-variable formula Lq that satisfies two axioms resembling the properties of the strict or nonstrict ordering on naturals. The choice of these axioms is motivated by an abstract account of Rosser's trick to improve on Gödel's First Incompleteness Theorem, reported in our CADE 2019 paper [1].

Chapter 4

Natural Deduction

We develop a natural deduction system based on the Hilbert system.

context *Deduct_with_False_Disj*
begin

4.1 Natural Deduction from the Hilbert System

definition *nprv* :: *'fmla set* ⇒ *'fmla* ⇒ *bool* **where**
nprv F φ ≡ *prv* (*imp* (*scnj F*) *φ*)

lemma *nprv_hyp*[*simp*,*intro*]:
φ ∈ *F* ⟹ *F* ⊆ *fmla* ⟹ *finite F* ⟹ *nprv F φ*
⟨*proof*⟩

4.2 Structural Rules for the Natural Deduction Relation

4.11 Eisbach Notation for Natural Deduction Proofs

The proof pattern will be: On a goal of the form *nprv F* φ, we apply a rule (usually an introduction, elimination, or cut/lemma-addition rule), then discharge the side-conditions with *auto*, ending up with zero, one or two goals of the same nprv-shape. This process is abstracted away in the Eisbach nrule method:

method *nrule* **uses** *r* = (*rule r*, *auto?*)

method *nrule2* **uses** *r* = (*rule r*, *auto?*)

Methods for chaining several nrule applications:

method *nprover2* **uses** *r1 r2* =
(−,(((*nrule r*: *r1*)*?*, (*nrule r*: *r2*)*?*) ; *fail*))
method *nprover3* **uses** *r1 r2 r3* =

Pseudo-Terms

Pseudo-terms are formulas that satisfy the exists-unique property on one of their variables.

5.1 Basic Setting

context *Generic_Syntax*
begin

We choose a specific variable, out, that will represent the "output" of pseudo-terms, i.e., the variable on which the exists-unique property holds:

abbreviation *out* ≡ *Variable 0*

Many facts will involve pseudo-terms with only one additional "input" variable, inp:

abbreviation *inp* ≡ *Variable* (*Suc 0*)

lemma *out_inp_distinct*[*simp*]:
out ≠ *inp inp* ≠ *out*
out ≠ *xx out* ≠ *yy yy* ≠ *out out* ≠ *zz zz* ≠ *out out* ≠ *xx′ xx′* ≠ *out*

inp ≠ *yy′ yy′* ≠ *inp inp* ≠ *zz′ zz′* ≠ *inp*

Pseudo-terms over the first $n + 1$ variables, i.e., having n input variables (Variable 1 to Variable n), and an output variable, out (which is an abbreviation for Variable 0).

5.2 The ∀-∃ Equivalence

There are two natural ways to state that (unique) "output" of a pseudo-term σ satisfies a property φ: (1) using ∃: there exists an "out" such that σ and φ hold for it; (2) using ∀: for all "out" such that σ holds for it, φ holds for it as well.

We prove the well-known fact that these two ways are equivalent. (Intuitionistic logic suffice to prove that.)

5.3 Instantiation

We define the notion of instantiating the "inp" variable of a formula (in particular, of a pseudo-term): – first with a term); – then with a pseudo-term.

5.3.1 Instantiation with terms

Instantiation with terms is straightforward using substitution. In the name of the operator, the suffix "Inp" is a reminder that we instantiate φ on its variable "inp".

context *Generic_Syntax*
begin

definition *instInp* :: *'fmla* ⇒ *'trm* ⇒ *'fmla* **where**
instInp φ $t \equiv$ *subst* φ t *inp*

lemma *instInp_fmla*[*simp*,*intro*]:
assumes $\varphi \in fmla$ **and** $t \in trm$
shows *instInp* φ $t \in fmla$
⟨*proof*⟩

lemma *Fvars_instInp*[*simp*,*intro*]:
assumes $\varphi \in fmla$ **and** $t \in trm$ *Fvars* $\varphi = \{inp\}$
shows *Fvars* (*instInp* φ t) = *FvarsT* t
⟨*proof*⟩

end — context *Generic_Syntax*

context *Deduct_with_False_Disj_Rename*
begin

lemma *Fvars_instInp_ptrm_1*[*simp*,*intro*]:
assumes τ: $\tau \in ptrm\ (Suc\ 0)$ **and** $t \in trm$
shows *Fvars* (*instInp* τ t) = *insert out* (*FvarsT* t)
⟨*proof*⟩

lemma *instInp*:

and [*simp*]: *FvarsT* t = *Variable* ‘ $\{(Suc\ 0)..n\}$
shows *instInp* τ $t \in ptrm\ n$
⟨*proof*⟩

lemma *instInp_0*:
assumes τ: $\tau \in ptrm\ (Suc\ 0)$ **and** $t \in trm$ **and** *FvarsT* $t = \{\}$
shows *instInp* τ $t \in ptrm\ 0$

⟨*proof*⟩

lemma *instInp_1*:
assumes τ: $\tau \in ptrm\ (Suc\ 0)$ **and** $t \in trm$ **and** $FvarsT\ t = \{inp\}$
shows $instInp\ \tau\ t \in ptrm\ (Suc\ 0)$
⟨*proof*⟩

5.3.2 Instantiation with pseudo-terms

Instantiation of a formula φ with a pseudo-term τ yields a formula that could be casually written $\varphi(\tau)$. It states the existence of an output *zz* of τ on which φ holds. Instead of $\varphi(\tau)$, we write $instInpP\ \varphi\ n\ \tau$ where n is the number of input variables of τ. In the name *instInpP*, *Inp* is as before a reminder that we instantiate φ on its variable "inp" and the suffix "P" stands for "Pseudo".

definition $instInpP :: 'fmla \Rightarrow nat \Rightarrow 'fmla \Rightarrow 'fmla$ **where**
$instInpP\ \varphi\ n\ \tau \equiv let\ zz = Variable\ (Suc\ (Suc\ n))\ in$
  $exi\ zz\ (cnj\ (subst\ \tau\ (Var\ zz)\ out)\ (subst\ \varphi\ (Var\ zz)\ inp))$

lemma *instInpP_fmla*[*simp*, *intro*]:
assumes $\varphi \in fmla$ **and** $\tau \in fmla$
shows $instInpP\ \varphi\ n\ \tau \in fmla$
⟨*proof*⟩

lemma *Fvars_instInpP*[*simp*]:
assumes $\varphi \in fmla$ **and** τ: $\tau \in ptrm\ n$ $Variable\ (Suc\ (Suc\ n)) \notin Fvars\ \varphi$
shows $Fvars\ (instInpP\ \varphi\ n\ \tau) = Fvars\ \varphi - \{inp\} \cup Variable\ `\ \{(Suc\ 0)..n\}$
⟨*proof*⟩

lemma *Fvars_instInpP2*[*simp*]:
assumes $\varphi \in fmla$ **and** τ: $\tau \in ptrm\ n$ **and** $Fvars\ \varphi \subseteq \{inp\}$
shows $Fvars\ (instInpP\ \varphi\ n\ \tau) = Fvars\ \varphi - \{inp\} \cup Variable\ `\ \{(Suc\ 0)..n\}$
⟨*proof*⟩

5.3.3 Closure and compositionality properties of instantiation

Instantiating a 1-pseudo-term with an n-pseudo-term yields an n pseudo-term:

lemma *instInpP1*[*simp*,*intro*]:
assumes σ: $\sigma \in ptrm\ (Suc\ 0)$ **and** τ: $\tau \in ptrm\ n$
shows $instInpP\ \sigma\ n\ \tau \in ptrm\ n$
⟨*proof*⟩

Term and pseudo-term instantiation compose smoothly:

lemma *instInp_instInpP*:
assumes φ: $\varphi \in fmla\ Fvars\ \varphi \subseteq \{inp\}$ **and** τ: $\tau \in ptrm\ (Suc\ 0)$
and $t \in trm$ **and** $FvarsT\ t = \{\}$
shows $instInp\ (instInpP\ \varphi\ (Suc\ 0)\ \tau)\ t = instInpP\ \varphi\ 0\ (instInp\ \tau\ t)$
⟨*proof*⟩

Pseudo-term instantiation also composes smoothly with itself:

lemma *nprv_instInpP_compose*:
assumes [*simp*]: $\chi \in fmla\ Fvars\ \chi = \{inp\}$
and σ[*simp*]: $\sigma \in ptrm\ (Suc\ 0)$ **and** τ[*simp*]: $\tau \in ptrm\ 0$
shows $nprv\ \{instInpP\ (instInpP\ \chi\ (Suc\ 0)\ \sigma)\ 0\ \tau\}$
  $(instInpP\ \chi\ 0\ (instInpP\ \sigma\ 0\ \tau))$ (**is** *?A*)
and
  $nprv\ \{instInpP\ \chi\ 0\ (instInpP\ \sigma\ 0\ \tau)\}$
  $(instInpP\ (instInpP\ \chi\ (Suc\ 0)\ \sigma)\ 0\ \tau)$ (**is** *?B*)

⟨*proof*⟩

lemma *prv_instInpP_compose*:
assumes [*simp*]: $\chi \in$ *fmla Fvars* $\chi = \{inp\}$
and σ[*simp*]: $\sigma \in$ *ptrm* (*Suc 0*) **and** τ[*simp*]: $\tau \in$ *ptrm 0*
shows *prv* (*imp* (*instInpP* (*instInpP* χ (*Suc 0*) σ) *0* τ)
(*instInpP* χ *0* (*instInpP* σ *0* τ))) (**is** *?A*)
and
prv (*imp* (*instInpP* χ *0* (*instInpP* σ *0* τ))
(*instInpP* (*instInpP* χ (*Suc 0*) σ) *0* τ)) (**is** *?B*)
and
prv (*eqv* (*instInpP* (*instInpP* χ (*Suc 0*) σ) *0* τ)
(*instInpP* χ *0* (*instInpP* σ *0* τ))) (**is** *?C*)
⟨*proof*⟩

5.4 Equality between Pseudo-Terms and Terms

Casually, the equality between a pseudo-term τ and a term t can be written as $\vdash \tau = t$. This is in fact the (provability of) the instantiation of τ with t on τ's output variable out. Indeed, this formula says that the unique entity denoted by τ is exactly t.

definition *prveqlPT* :: *'fmla* ⇒ *'trm* ⇒ *bool* **where**
prveqlPT τ *t* ≡ *prv* (*subst* τ *t out*)

We prove that term–pseudo-term equality indeed acts like an equality, in that it satisfies the substitutivity principle (shown only in the particular case of formula-input instantiation).

7.2 The (Nonstrict and Strict) Order Relations

Lq (less than or equal to) is a formula with free vars xx and yy. NB: Out of the two possible ways, adding zz to the left or to the right, we choose the former, since this seems to enable Q (Robinson arithmetic) to prove as many useful properties as possible.

definition *Lq* :: *'fmla* **where**
Lq ≡ *exi zz* (*eql* (*Var yy*) (*pls* (*Var zz*) (*Var xx*)))

Alternative, more flexible definition , for any non-capturing bound variable:

lemma *Lq_def2*: *z* ∈ *var* ⟹ *z* ≠ *yy* ⟹ *z* ≠ *xx* ⟹ *Lq* = *exi z* (*eql* (*Var yy*) (*pls* (*Var z*) (*Var xx*)))
⟨*proof*⟩

lemma *Lq*[*simp*,*intro*!]: *Lq* ∈ *fmla*
⟨*proof*⟩

lemma *Fvars_Lq*[*simp*]: *Fvars Lq* = {*xx*,*yy*}
⟨*proof*⟩

As usual, we also define a predicate version:

definition *LLq* **where** *LLq* ≡ λ *t1 t2*. *psubst Lq* [(*t1*,*xx*), (*t2*,*yy*)]

lemma *LLq*[*simp*,*intro*]:
assumes *t1* ∈ *trm t2* ∈ *trm*
shows *LLq t1 t2* ∈ *fmla*
⟨*proof*⟩

lemma *LLq2*[*simp*,*intro*!]:
n ∈ *num* ⟹ *LLq n* (*Var yy'*) ∈ *fmla*
⟨*proof*⟩

lemma *Fvars_LLq*[*simp*]: *t1* ∈ *trm* ⟹ *t2* ∈ *trm* ⟹
Fvars (*LLq t1 t2*) = *FvarsT t1* ∪ *FvarsT t2*
⟨*proof*⟩

This lemma will be the working definition of LLq:

lemma *LLq_pls*:
assumes [*simp*]: *t1* ∈ *atrm t2* ∈ *atrm z* ∈ *var z* ∉ *FvarsT t1 z* ∉ *FvarsT t2*
shows *LLq t1 t2* = *exi z* (*eql t2* (*pls* (*Var z*) *t1*))
⟨*proof*⟩

lemma *LLq_pls_zz*:
assumes *t1* ∈ *atrm t2* ∈ *atrm zz* ∉ *FvarsT t1 zz* ∉ *FvarsT t2*
shows *LLq t1 t2* = *exi zz* (*eql t2* (*pls* (*Var zz*) *t1*))
⟨*proof*⟩

If we restrict attention to arithmetic terms, we can prove a uniform substitution property for LLq:

lemma *subst_LLq*[*simp*]:
assumes [*simp*]: *t1* ∈ *atrm t2* ∈ *atrm s* ∈ *atrm x* ∈ *var*
shows *subst* (*LLq t1 t2*) *s x* = *LLq* (*substT t1 s x*) (*substT t2 s x*)

assumes *1*: *t1* ∈ *atrm t2* ∈ *atrm fst* ‘ *set txs* ⊆ *atrm*
and *2*: *snd* ‘ *set txs* ⊆ *var*
and *3*: *distinct* (*map snd txs*)
shows *psubst* (*LLq t1 t2*) *txs* = *LLq* (*psubstT t1 txs*) (*psubstT t2 txs*)
⟨*proof*⟩

Lq less than) is the strict version of the order relation. We prove similar facts as for Lq

definition *Ls* :: *'fmla* **where**
Ls ≡ *cnj Lq* (*neg* (*eql* (*Var xx*) (*Var yy*)))

The working definition of LLs:

lemma *LLs_LLq*:
t1 ∈ *atrm* ⟹ *t2* ∈ *atrm* ⟹
LLs t1 t2 = *cnj* (*LLq t1 t2*) (*neg* (*eql t1 t2*))
⟨*proof*⟩

lemma *subst_LLs*[*simp*]:
